

Data Sheet

This document describes the performance and features of the Agilent Technologies PNA microwave network analyzers:

E8362B	10 MHz to 20 GHz
E8363B	10 MHz to 40 GHz
E8364B	10 MHz to 50 GHz
E8361A	10 MHz to 67 GHz

Note:

For the complete and most current instrument, calibration kit and connector specifications, refer to the online Help file in the "manuals" library on our web site: http://na.tm.agilent.com/pna

## **Some Definitions**

All specifications and characteristics apply over a  $25 \text{ °C} \pm 5 \text{ °C}$  range (unless otherwise stated) and 90 minutes after the instrument has been turned on.

**Calibration:** The process of measuring known standards to characterize a network analyzer's systematic (repeatable) errors.

**Characteristic (char.):** A performance parameter that the product is expected to meet before it leaves the factory, but that is not verified in the field and is not covered by the product warranty. A characteristic includes the same guardbands as a specification.

**Corrected (residual):** Indicates performance after error correction (calibration). It is determined by the quality of calibration standards and how well "known" they are, plus system repeatability, stability, and noise. **Nominal (nom.):** A general, descriptive term that does not imply a level of performance. It is not covered by the product warranty.

**Specification (spec.):** Warranted performance. Specifications include guardbands to account for the expected statistical performance distribution, measurement uncertainties, and changes in performance due to environmental conditions.

**Standard:** When referring to the analyzer, this includes no options unless noted otherwise.

**Typical (typ.):** Expected performance of an average unit, which does not include guardbands. It is not covered by the product warranty.

**Uncorrected (raw):** Indicates instrument performance without error correction. The uncorrected performance affects the stability of a calibration.

## **Microwave PNA Series**

## **Corrected system performance**

The specifications in this section apply for measurements made with the Agilent E8362/3/4B PNA Series microwave network analyzer with the following conditions:

- 10 Hz IF bandwidth
- no averaging applied to data
- isolation calibration with an averaging factor of 8

**Note:** Samples of uncertainty curves are included in this Data Sheet. Please download our free uncertainty calculator (**www.agilent.com/find/na\_calculator**) to generate the curves for your setup.

### System dynamic range<sup>1</sup>

 The system dynamic range is calculated as the difference between the noise floor and the source maximum output power. System dynamic range is a specification when the source is set to port 1, and a characteristic when the source is set to port 2. The effective dynamic range must take measurement uncertainties and interfering signals into account.

The test port system dynamic range is calculated as the difference between the test port noise floor and the source maximum output power. The effective dynamic range must take measurement uncertainties and interfering signals into account.

3. The direct receiver access input system dynamic range is calculated as the difference between the direct receiver access input noise floor and the source

maximum output power. The effective dynamic range must take measurement uncertainties and interfering signals into account. This set-up should only be used when the receiver input will never exceed its damage level. When the analyzer is in segment sweep mode, the analyzer can have pre-defined frequency segments which will output a higher power level when the extended dynamic range is required (i.e. devices with high insertion loss), and reduced power when receiver damage may occur (i.e. devices with low insertion loss). The extended range is only available in one-path transmission measurements.

4. Typical performance.

 May be limited to 100 dB at particular frequencies below 500 MHz due to spurious receiver residuals. Methods are available to regain the full dynamic range.

 The receiver dynamic range is calculated as the difference between the noise floor and the receiver maximum input level. The effective dynamic range must take measurement uncertainties and interfering signals into account.

The test port receiver dynamic range is calculated as the difference between the test port noise floor and the receiver maximum input level. The effective dynamic range must take measurement uncertainties and interfering signals into account.

3. The direct receiver access input receiver dynamic range is calculated as the difference between the direct receiver access input noise floor and the receiver maximum input level. The effective dynamic range must take measurement uncertainties and interfering signals into account. This set-up should only be used

when the receiver input will never exceed its compression or damage level. When the analyzer is in segment sweep mode, the analyzer can have pre-defined frequency segments which will output a higher power level when the extended dynamic range is required (i.e. devices with high insertion loss), and reduced power when compression or receiver damage may occur (i.e. devices with low insertion loss). The extended range is only available in one-path transmission measurements.

 May be degraded by 10 dB at particular frequencies (multiples of 5 MHz) below 500 MHz due to spurious receiver residuals. Methods are available to regain the full dynamic range.

### Corrected system performance with 2.4 mm connectors

### Standard configuration and standard power range (E8363/4B)

Applies to E8363/4B PNA Series analyzer, 85056A (2.4 mm) calibration kit, 85133F flexible test port cable set, and a full two-port calibration. (Specifications apply over environmental temperature of 23 °C  $\pm$ 3 °C, with less than 1 °C deviation from calibration temperature.)

<sup>3.</sup> Stability is defined as a ratio measurement measured at the test port.

Typical performance.
 Trace noise magnitude may be degraded to 20 mdB rms at harmonic frequencies of the first IF (8.33 MHz) below 80 MHz.

<sup>4. 0</sup> Hz offset.

## E8362/3/4B Test port input *continued*

## Group delay<sup>1</sup>

Description	Specification	Supplemental information (typical)
Aperture (selectable)		(frequency span)/(number of points – 1)
Maximum aperture		20% of frequency span
Range		0.5 x (1/minimum aperture)
Maximum delay		Limited to measuring no more than 180° of
		phase change within the minimum aperture.

The following graph shows characteristic group delay accuracy with type-N full 2-port calibration and a 10 Hz IF bandwidth. Insertion loss is assumed to be less than 2 dB and electrical length to be 10 m.

### Group delay (typical)

In general, the following formula can be used to determine the accuracy, in seconds, of a specific group delay measurement:

±Phase accuracy (deg)/[360 x Aperture (Hz)]

Depending on the aperture and device length, the phase accuracy used is either incremental phase accuracy or worse case phase accuracy.

<sup>1.</sup> Group delay is computed by measuring the phase change within a specified frequency step (determined by the frequency span and the number of points per sweep).

## E8362/3/4B Test port input *continued* Dynamic accuracy (specifications)<sup>1</sup>

Applies to input ports 1 and 2, accuracy of the test port input power reading relative to the reference

1. Dynamic accuracy is verified with the following measurements: compression over frequency, IF linearity at a single frequency of 1.195 GHz and a reference level of -20 dBm for an input power range of 0 to -120 dBm.

input power level. Also applies to the following conditions:

• IF bandwidth = 10 Hz

## **Corrected system performance**

The specifications in this section apply for measurements made with the Agilent E8361A PNA Series microwave network analyzer with the following conditions:

- 10 Hz IF bandwidth
- no averaging applied to data

 The system dynamic range is calculated as the difference between the noise floor and the source maximum output power. System dynamic range is a specification when the source is set to port 1, and a characteristic when the source is set to port 2. The effective dynamic range must take measurement uncertainties and interfering signals into account, as well as the insertion loss resulting from a thru cable connected between port 1 and port 2.

- 2. The test port system dynamic range is calculated as the difference between the test port noise floor and the source maximum output power. The effective dynamic range must take measurement uncertainties and interfering signals into account, as well as the insertion loss resulting from a thru cable connected between port 1 and port 2.
- 3. The direct receiver access input system dynamic range is calculated as the difference between the direct receiver access input noise floor and the source maximum output power. The effective dynamic range must take measurement uncertainties and interfering signals into account. This set-up should only be used when the receiver input will never exceed its damage level. When the analyzer is in segment sweep mode, the analyzer can have pre-defined frequency segments which will output a higher power level when the extended dynamic range is required (i.e. devices with high insertion loss), and reduced power when receiver damage may occur (i.e. devices with low insertion loss). The extended range is only available in one-path trans mission measurements.
- 4. Typical performance.

 May be limited to 100 dB at particular frequencies below 500 MHz due to spurious receiver residuals. Methods are available to regain the full dynamic range.

## Corrected system performance with 1.85 mm connectors

### Standard configuration and standard power range

Applies to E8361A PNA Series analyzer, N4694A (1.85 mm) ECal electronic calibration module, N4697E/F flexible test port cable set, and a full two-port calibration. ### Corrected system performance with 1.85 mm connectors continued

### Fully optioned (E8361A with options 014/UNL/080/081/016)

Applies to E8361A PNA Series analyzer, N4694A (1.85 mm) ECal electronic calibration module, 85133F flexible test port cable set, and a full two-port calibration. (Specifications apply over environmental temperature of 23 °C  $\pm$ 3 °C, with less than 1 °C deviation from calibration temperature.)

1. Preset power.

characteristic when the source is set to port 2.

3. Typical performance.

4. Power level linearity is a specification when the source is set to port 1, and a typical when the source is set to port 2.

5.  $\pm 1.6 \text{ dB}$  for power > -5 dBm.

6. Power to which the source can be set and phase lock is assured.

7. Test port is specified into a nominal 50  $\Omega.$ 

<sup>2.</sup> Test port output is a specification when the source is set to port 1, and a  $% \left( {{{\bf{x}}_{{\rm{s}}}}} \right)$ 

Description	Specification	Supplemental information
Phase noise (10 kHz o	offset from center frequency, nominal power	at test port)

and <0.15 dB at +2 dBm<sup>8</sup>

- 3. Coupler roll-off will reduce compression to a negligible level below 500 MHz.
- 4. Noise floor may be degraded by 10 dB at particular frequencies (multiples of 5 MHz) due to spurious receiver residuals.

5. Specified value is for worst-case noise floor at 45 MHz.

6. Specified value is for worst-case compression at 500 MHz.

7. This compression level comes from the dynamic accuracy curve with -30 dBm reference test port power.

8. Option 016 degrades performance by 3 dB.

<sup>1.</sup> Total average (rms) noise power calculated as mean value of a linear magnitude trace expressed in dBm.

<sup>2.</sup> Typical performance.

67 to 70 GHz	< 0.100° rms	< 0.100° rms	

1. Third order intercept is a typical specification that applies while the network analyzer receiver is in its linear range.

2. Typical performance.

3. 0 Hz offset.

 Trace noise magnitude may be degraded to 20 mdB rms at harmonic frequencies of the first IF (8.33 MHz) below 80 MHz.

5. Specified value is for worst-case noise floor at 45 MHz.

A, B in			+15 dBm or ±7 VDC, typical
Coupler thru (Option 014)			+27 dBm or ±40 VDC, typica
Coupler arm (Option 014)			+30 dBm or ±7 VDC, typical
Source out (reference)			+15 dBm or ±15 VDC, typica
Source out (test ports)			+27 dBm or ±5 VDC, typical

1. Stability is defined as a ratio measurement measured at the test port.

### Group delay <sup>1</sup>

Description	Specification	Supplemental information (typical)
Aperture (selectable)		(frequency span)/(number of points – 1)
Maximum aperture		20% of frequency span
Range		0.5 x (1/minimum aperture)
Maximum delay		Limited to measuring no more than 180° of
-		phase change within the minimum aperture.

The following graph shows characteristic group delay accuracy with type-N full 2-port calibration and a 10 Hz IF bandwidth. Insertion loss is assumed to be less than 2 dB and electrical length to be 10 m.

#### Group delay (typical)

In general, the following formula can be used to determine the accuracy, in seconds, of a specific group delay measurement:

±Phase accuracy (deg)/[360 x Aperture (Hz)]

Depending on the aperture and device length, the phase accuracy used is either incremental phase accuracy or worse case phase accuracy.

<sup>1.</sup> Group delay is computed by measuring the phase change within a specified frequency step (determined by the frequency span and the number of points per sweep).

#### Dynamic accuracy (specification)<sup>1</sup>

Applies to input ports 1 and 2, accuracy of the test port input power reading relative to the reference input power level. Also applies to the following conditions:

• IF bandwidth = 10 Hz

**Note:** If the power is set above maximum specified leveled power, the test port output signal may show non-linear effects that are dependent on the DUT.

1. Dynamic accuracy is verified with the following measurements: compression over frequency, IF linearity at a single frequency of 1.195 GHz and and a reference level of -20 dBm for an input power range of 0 to -120 dBm.

#### Dynamic accuracy (specification)<sup>1</sup>

Applies to input ports 1 and 2, accuracy of the test port input power reading relative to the reference input power level. Also applies to the following conditions:

• IF bandwidth = 10 Hz

**Note:** If the power is set above maximum specified leveled power, the test port output signal may show non-linear effects that are dependent on the DUT.

<sup>1.</sup> Dynamic accuracy is verified with the following measurements: compression over frequency, IF linearity at a single frequency of 1.195 GHz and and a reference level of -20 dBm for an input power range of 0 to -120 dBm.

#### Dynamic accuracy (specification)<sup>1</sup>

Applies to input ports 1 and 2, accuracy of the test port input power reading relative to the reference input power level. Also applies to the following conditions:

• IF bandwidth = 10 Hz

**Note:** If the power is set above maximum specified leveled power, the test port output signal may show non-linear effects that are dependent on the DUT.

1. Dynamic accuracy is verified with the following measurements: compression over frequency, IF linearity at a single frequency of 1.195 GHz and and a reference level of -20 dBm for an input power range of 0 to -120 dBm.

#### Dynamic accuracy (specification)<sup>1</sup>

Applies to input ports 1 and 2, accuracy of the test port input power reading relative to the reference input power level. Also applies to the following conditions:

• IF bandwidth = 10 Hz

**Note:** If the power is set above maximum specified leveled power, the test port output signal may show non-linear effects that are dependent on the DUT.

 Dynamic accuracy is verified with the following measurements: compression over frequency, IF linearity at a single frequency of 1.195 GHz and and a reference level of -20 dBm for an input power range of 0 to -120 dBm.

## Microwave PNA Series Rear panel

Description	Supplemental information	
External trigger rear panel I/O (typical)		
Trigger input		
Function	Measurement of next point, next channel, or next group of channels	
Source	Aux I/O (pin 19) or I/O 1 (BNC (f) connector)	
Signal levels	TTL-compatible	
Input impedance	5 k $\Omega$ nominal	
Minimum trigger width	1 µs	
Trigger modes	High or low level; positive or negative edge	
Trigger delay range	0 to 1 sec	
Trigger delay resolution	6 μs (IF bandwidth ≥ 15 kHz) or 6.2 us (IF bandwidth <15 kHz)	
Trigger output		
Function	Generate pulse before or after measurement	
	(only active when trigger type is external)	
Source	I/O 2 (BNC (f) connector)	
Signal levels	TTL-compatible	
Trigger polarity	Positive or negative edge	
Pulse width	1 µs	
Option H11 rear panel I/O (typical)		
External IF inputs		
Function	Allows use of external IF signals from remote mixers, bypassing the	
	PNA's first converters	
Connectors	BNC (f), for B, R2, R1, A receivers	
Input frequency	8.33 MHz	
Input impedance	50 $\Omega$ nominal	
RF damage level	–20 dBm	
DC damage level	25 Volts	
0.1 dB compression point	–27 dBm	
Test Set Drivers		
Function	Used for driving remote mixers	
Connectors	SMA (f) for RF and LO outputs	
RF, LO output frequency range	1.7 to 20 GHz	
RF output power levels	+5 to –16 dBm, depending on frequency <sup>1</sup>	
LO output power levels	–7 to –16 dBm, depending on frequency	
Pulse inputs (IF gates) <sup>2</sup>		
Function	Internal receiver gates used for point-in-pulse and pulse-profile	
	measurements	
Connectors	BNC (f), for B, R2, R1, A receivers	
Input impedance	1 k $\Omega$ nominal	
Minimum pulse width	20 ns for less than 1 dB deviation from theoretical performance <sup>3</sup>	
DC damage level	5.5 Volts	
Signal levels	TTL; 0 V (off), +5 V (on) nominal	

1. Measured at -5 dBm test port power.

<sup>2.</sup> Pulse input connectors are operational only with Option H08 (Pulsed Measurement Capability) enabled.

<sup>3.</sup> Based on deviation from signal reduction equation:

Signal Reduction (dB) = 20log<sub>10</sub>(Duty\_cycle) = 20log<sub>10</sub>(pulse\_width/pulse\_repetition\_interval). Measured at pulse repetition frequency of 1 MHz.

### Rear panel continued

Description	Supplemental information	
10 MHz reference in		
Input frequency	10 MHz ±10 ppm, typ.	
Input power	-15 to +20 dBm, typ.	
Input impedance	200 Ω, nom.	
10 MHz reference out		
Output frequency	10 MHz ±10 ppm, typ.	
Signal type	Sine wave, typ.	
Output power	10 dB $\pm$ 4 dB into 50 $\Omega$ , typ.	
Output impedance	50 $\Omega$ , nom.	
Harmonics	< -40 dBc, typ.	
VGA video output	15-pin mini D-Sub; Drives VGA compatible monitors	
GPIB	Type D-24, 24-pin; female compatible with IEEE-488	
Parallel port (LPT1)	25-pin D-sub miniature connector; provides connection to printers or any other	
	parallel port peripheral	
Serial port (COM1)	9-pin D-Sub; male compatible with RS-232	
USB port 1 port on front panel and 5 ports on rear panel, universal serial bus ja		
	Type-A configuration (4 contacts inline, contact 1 on left); female	
Contact 1	Vcc: 4.75 to 5.25 VDC, 500 mA max	
Contact 2	-Data	
Contact 3	+Data	
Contact 4	Ground	
LAN	10/100 BaseT Ethernet; 8-pin configuration auto selects between the two data rates	
Test set I/O	25-pin D-sub; available for external test set control	
Handler I/O	36-pin, parallel I/O port; all input/output signals are default set to negative logic;	
	can be reset to positive logic via GPIB command	
Auxiliary I/O	25-pin D-sub male connector; analog and digital I/O	
Bias tee inputs		
Connectors	BNC (f), for port 1 and port 2	
Maximum voltage	±40 V DC	
Maximum current	±200 mA with no degradation of RF specifications	
Fuse	500 mA, bi-pin style	

## Microwave PNA Series Measurement throughput summary

### Cycle time vs. IF bandwidth<sup>1</sup>

Instrument state: preset condition, 201 points, CF = 28 GHz, Span = 100 MHz, correction off. Add 21 ms for display on. Cycle time includes sweep and re-trace time.

IF bandwidth (Hz)	Cycle time (ms)	Cycle time (ms) Option 080 enabled
40,000	11	100

1. Typical performance, using an Agilent PSG (E8257D) signal generator for the external LO source.

2. Typical performance.

### **Measurement capabilities**

#### Number of measurement channels

Thirty-two independent measurement channels. A measurement channel is coupled to stimulus settings including frequency, IF bandwidth, power level, and number of points.

#### Number of display windows

Up to 16 display windows. Each window can be sized and re-arranged. Up to four measurement channels can be displayed per window.

#### Number of traces

Up to four active traces and four memory traces per window. Measurement traces include S-parameters, as well as relative and absolute power measurements.

#### **Measurement choices**

S11, S21, S12, S22, A/R1, A/R2, A/B, B/R1, B/R2, B/A, R1/A, R1/B, R1/R2, R2/A, R2/B, R2/R1, A, B, R1, R2

#### **Formats**

Log or linear magnitude, SWR, phase, group delay, real and imaginary, Smith chart, polar.

#### **Data markers**

Ten independent markers per trace. Reference marker available for delta marker operation. Marker formats include log or linear magnitude, phase, real, imaginary, SWR, delay, R + jX, and G + jB.

#### **Marker functions**

#### Marker search

Maximum value, minimum value, target, next peak, peak right, peak left, target, and bandwidth with user-defined target values

#### Marker-to functions

Set start, stop, and center to active marker stimulus value; set reference to active marker response value; set electrical delay to active marker phase response value.

#### Trace statistics

Calculates and displays mean, standard deviation and peak-to-peak deviation of the data trace.

#### Tracking

Performs new search continuously or on demand.

### Source control

#### Measured number of points per sweep

User definable from 2 to 16,001.

#### Sweep type

Linear, CW (single frequency), power or segment sweep.

#### Segment sweep

Define up to 101 different, sub-sweep frequency ranges in any combination of start-stop sweep modes. Set number of points, test port power levels, IF bandwidth, and dwell time independently for each segment.

#### Sweep trigger

Set to continuous, hold, single, or group sweep with internal or external trigger.

#### Power

Power slope can be set in dBm/GHz. Control the test port signal by setting the internal attenuator of the test set over a 60-dB range.

### **Trace functions**

#### **Display data**

Display current measurement data, memory data, or current measurement with measurement and memory data simultaneously.

#### **Trace math**

Vector addition, subtraction, multiplication or division of current linear measurement values and memory data.

#### **Display annotations**

Start/stop, center/span, or CW frequency, scale/div, reference level, marker data, warning and caution messages, trace status, and pass/fail indication.

#### Title

Add custom titles (50 characters maximum) to the display. Titles will be printed when making hardcopies of displayed measurements.

#### Autoscale

Automatically selects scale resolution and reference value to center the trace.

#### **Electrical delay**

Offset measured phase or group delay by a defined amount of electrical delay, in seconds.

#### Phase offset

Offset measured phase or group delay by a defined amount in degrees.

### Automation

	GPIB	LAN	Internal
SCPI	Х	Х	Х
COM/DCOM		Х	Х

#### Methods

#### Controlling via internal analyzer execution

Write applications that can be executed from within the analyzer via COM (component object model) or SCPI standard-interface commands. These applications can be developed in a variety of languages, including Visual Basic, Visual C++, Agilent VEE, or LabView<sup>™</sup> programming languages.

#### Controlling via GPIB

The GPIB interface operates to IEEE 488.2 and SCPI standard-interface commands. The analyzer can either be the system controller, or talker/listener.

#### Controlling via LAN

The built-in LAN interface and firmware support data transfer and control via direct connection to a 10 Base-T network.

#### SICL/LAN Interface

The analyzer's support for SICL (standard instrument control library) over the LAN provides control of the network analyzer using a variety of computing platforms, I/O interfaces, and operating systems. With SICL/LAN, the analyzer is controlled remotely over the LAN with the same methods used for a local analyzer connected directly to the computer via a GPIB interface.

#### **DCOM Interface**

The analyzer's support for DCOM (distributed component object model) over the LAN provides control of the network analyzer using a variety of platforms. DCOM acts as an interface to the analyzer for external applications. With DCOM, applications can be developed or executed from an external computer. During development, the application can interface to the analyzer over the LAN through the DCOM interface. Once development is completed, the application can be distributed to the analyzer and interfaced using COM.

### Data accuracy enhancement

#### **Measurement calibration**

Measurement calibration significantly reduces measurement uncertainty due to errors caused by system directivity, source and load match, tracking and crosstalk. Full two-port calibration removes all the systematic errors to obtain the most accurate measurements.

#### **Calibration types available**

#### Frequency response

Simultaneous magnitude and phase correction of frequency response errors for either reflection or transmission measurements.

#### Response and isolation

Compensates for frequency response and directivity (reflection) or frequency response and crosstalk errors.

#### **One-port calibration**

Uses test set port 1 or port 2 to correct for directivity, frequency response and source match errors.

#### Two-port calibration

Compensates for directivity, source match, reflection frequency response, load match, transmission frequency response and crosstalk. Crosstalk calibration can be omitted.

#### Mixer Calibration

#### Scalar-mixer calibration:

Scalar-mixer calibration corrects the conversion loss for input port source match, output port load match, absolute input or source power, and absolute output or receiver power. Scalar-mixer calibrations also corrects the input match measurements (S11) for input port directivity, frequency response and source match at the input frequencies and corrects the output match measurement (S22) for output directivity, frequency response and source match at the output frequencies.

#### Vector-mixer calibration:

At the input frequencies of the mixer, the vector-mixer calibration compensates for directivity, source match, and reflection frequency response. At the output frequencies of the mixer, the vector-mixer calibration compensates for directivity, load match, and reflection frequency response. Frequency-translated transmission response is compensated by using a characterized calibration mixer. The characterization of the calibration mixer is part of the calibration process.

#### TRL/TRM calibration

Compensates for directivity, reflection and transmission frequency response and crosstalk in both forward and reverse directions. Provides the highest accuracy for both coaxial and non-coaxial environments, such as on-wafer probing, in-fixture or waveguide measurements.

#### Interpolated error correction

With any type of accuracy enhancement applied, interpolated mode recalculates the error coefficients when the test frequencies are changed. The number of points can be increased or decreased and the start/stop frequencies can be changed, but the resulting frequency range must be within the original calibration frequency. System performance is not specified for measurements with interpolated error correction applied.

#### Velocity factor

Enters the velocity factor to calculate the equivalent electrical length.

#### Reference plane extension

Redefine the plane-of-measurement reference to other than port 1 or port 2.

### Storage

#### Internal hard disk drive

Store and recall binary instrument states and calibration data on 10 GB, minimum, internal hard drive. Instrument data can also be saved in ASCII (including S2P) format. All files are MS-DOS®-compatible. Instrument states include all control settings, active limit lines, active list frequency tables, memory trace data.

#### **Disk drive**

Instrument data, instrument states, and calibration data can be stored on internal 3.5-in, 1.4 MB floppy disk in MS-DOS-compatible format.

#### Data hardcopy

Printouts of instrument data are directly produced on any printer with the appropriate Windows<sup>®</sup> 2000 printer driver. The analyzer provides USB, Centronics (parallel), serial and LAN interfaces.

### **System capabilities**

#### Familiar graphical user interface

The PNA Series employs a graphical user interface based on Windows 2000. There are two fundamental ways to operate the instrument manually: you can use a hardkey interface, or use drop-down menus driven from a mouse (or another standard USB pointing device). Hardkey navigation brings up active toolbars that perform most of the operations required to configure and view measurements. Front-panel navigation keys allow for use of the instrument without a mouse. In addition, mouse-driven pull-down menus provide easy access to both standard and advanced features. Both methods employ dialog boxes to display all the choices needed to make measurement set-ups.

#### **Built-in information system**

Embedded documentation provides measurement assistance in five different languages (English, Chinese, French, German, Japanese, and Spanish). A thorough index of help topics and context-sensitive help is available from dialog boxes.

#### **Limit lines**

Define test limit lines that appear on the display for go/no go testing. Lines may be any combination of horizontal, sloping lines, or discrete data points.

#### Time-domain (Option 010)

With the time-domain option, data from transmission or reflection measurements in the frequency domain are converted to the time domain using a Fourier transformation technique (chirp Z) and presented on the display. The time-domain response shows the measured parameter value versus time. Markers may also be displayed in electrical length (or physical length if the relative propagation velocity is entered).

#### 4-port measurement application (Option 550)

Enables full 4-port error correction and differential measurements on a 2-port network analyzer. External test set must be connected. User installable.

#### Time stimulus modes

Two types of time excitation stimulus waveforms can be simulated during the transformations, a step and an impulse.

#### Low-pass step

This stimulus, similar to a traditional time-domain reflectometer (TDR) stimulus waveform, is used to measure low-pass devices. The frequency-domain data should extend from DC (extrapolated value) to a higher value. The step response is typically used for reflection measurements only.

#### Low-pass impulse

This stimulus is also used to measure low-pass devices. The impulse response can be used for reflection or transmission measurements.

#### Bandpass impulse

The bandpass impulse stimulates a pulsed RF signal (with an impulse envelope) and is used to measure the time-domain response of band-limited devices. The start and stop frequencies are selectable by the user to any values within the limits of the test set used. Bandpass time-domain responses are useful for both reflection and transmission measurements.

#### Time-domain range

The "alias-free" range over which the display is free of response repetition depends on the frequency span and the number of points. Range, in nanoseconds, is determined by: Time-domain range = (number of points - 1)/frequency span [in GHz]

#### Range resolution

The time resolution of a time-domain response is related to range as follows: Range resolution = time span/(number of points - 1)

#### Windows

The windowing function can be used to modify (filter) the frequency-domain data and thereby reduce over-shoot and ringing in the time-domain response. Kaiser Beta windows are available.

#### Gating

The gating function can be used to selectively remove reflection or transmission time-domain responses. In converting back to the frequency-domain the effects of the responses outside the gate are removed.

#### Configurable test set (Option 014)

With the configurable test set option, front panel access loops are provided to the signal path between the source output and coupler input.

#### Extended dynamic range configuration

Reverse the signal path in the coupler and bypass the loss typically associated with the coupled arm. Change the port 2 switch and coupler jumper configurations to increase the forward measurement dynamic range. When making full two-port error corrected measurements, the reverse dynamic range is degraded by 12 to 15 dB.

#### High power measurement configuration

Add external power amplifier(s) between the source output and coupler input to provide up to +30 dBm of power at the test port(s). Full two-port error correction measurements possible. When the DUT output is expected to be greater than +30 dBm, measure directly at the B input and use an external fixed or step attenuator to prevent damage to the receiver. For measurements greater than +30 dBm, add external components such as couplers, attenuators, and isolators.

#### Extended power range and bias-tees (Option UNL)

Adds two 60 dB step attenuators (50 dB for E8361A) and two bias-tees. A step attenuator and bias-tee set is inserted between the source and test port one and another set between the source and test port two.

#### Frequency-offset (Option 080)

This option enables the PNA Series microwave network analyzers to set the source frequency independently from where the receivers are tuned. This ability is important for two general classes of devices: mixers (and converters) and amplifiers. For frequency-translating devices like mixers or converters, frequency-offset capability is necessary for conversion loss/gain measurements (both amplitude and phase), since, by definition, the input and output frequency of the DUT are different. For amplifier measurements, frequency offset capability is required to measure amplifier harmonics or when using the internal source as one of the stimuli of an IMD measurement. Option 080 provides a very basic user interface. The user may enter multiplier and offset values to describe how the instrument's receivers track the source frequency. While flexible, the user interface requires the user to calculate the correct values. The frequency-converter application (Option 083) provides a much more intuitive and easy-to-use user interface, designed specifically for mixer and converter measurements.

#### **Reference channel switch (Option 081)**

Option 081 adds a solid-state internal RF transfer switch in the R1 reference-receiver path. The switch allows the instrument to easily switch between standard S-parameter (non-frequency-offset) measurements and frequencyoffset measurements such as relative phase or absolute group delay that require an external reference mixer. The user can set the switch manually or remotely, but it is best used with the frequency-converter application (Option 083), where it is controlled automatically during the vector-mixer calibration procedure.

#### IF Access (Option H11)

Provides hardware to enable antenna, point-in-pulse, and pulse-profile measurements, as well as broadband millimeter-wave measurements to 110 GHz, and banded millimeter-wave measurements to 325 GHz. For each of the microwave PNA's measurement receivers, IF gates (enabled with pulsed-RF measurement capability Option H08) and external IF inputs are added. In addition, access to the PNA's internal RF and LO sources is provided for remote-mixing applications. For basic antenna measurements, only Option H11 is necessary. Pulsed-antenna applications also require the pulsedmeasurement capability (Option H08). Millimeter-wave measurements also require an N5260A millimeter-wave test set controller.

#### **Pulsed-RF measurement capability (Option H08)**

Provides software to set up and control pulsed-RF measurements with point-in-pulse and pulse-profile capability. The software sets the coefficients of the PNA's digital-IF filter to null out unwanted spectral components, enables the IF gates provided with IF access (Option H11), and controls the Agilent 81110A family of pulse generators. The software can be run on the PNA or an external computer, and a ".dll" file containing the IF-filter algorithm is included for automated pulsed-RF testing.

#### Frequency-converter application (Option 083)

The frequency-converter application adds an intuitive and easy-to-use user interface, advanced calibration choices that provide exceptional amplitude and phase accuracy, and control of external signal sources for use as local oscillators. A graphical set-up dialog box lets you quickly set up the instrument for single or dual conversion devices. This set-up screen also helps you calculate and choose where mixing and image products will fall.

#### Add receiver attenuator (Option 016)

A 35 dB attenuator with 5 dB steps (50 dB attenuator with 10 dB steps for E8361A only) is added between both test ports and their corresponding receiver. See page 53 for a basic block diagram.

#### **Extended memory (Option 022)**

More RAM is added for a total of 512 MB.

#### Commercial calibration certificate with test data (Option UK6)

Complete set of measurements which tests unit to manufacturer's published specifications. Includes calibration label, calibration certificate, and data report. Conforms to ISO 9001.

#### ISO 17025 compliant calibration (Option 1A7)

Complete set of measurements which tests unit to manufacturer's published specifications. Includes calibration label, ISO 17025 calibration certificate, and data report, measurement uncertainties and guardbands on all customer specifications. Conforms to ISO 17025 and ISO 9001.

#### ANSI Z540 compliant calibration (Option A6J)

Complete set of measurements which tests unit to manufacturer's published specifications. Includes pre and post-adjustment data with measurement uncertainty information compliant to the ANSI/NCSL Z540 standard.

#### Supplemental performance

Minimum reference channel input level (Option 080 disabled): -35 dBm

### Simplified test set block diagram

#### Standard power range

#### Extended power range and bias-tees (Option UNL)

#### **Configuration test set (Option 014)**

# Configurable test set with extended power range and bias-tees (Option UNL and 014)

1. Source attenuator for E8362/3/4B is 60 dB in 10 dB steps. Source attenuator for E8361A is 50 dB in 10 dB steps.

#### Fully optioned (Options 014, UNL, 016, 080, 081)

Fully optioned pulse, antenna, or mm-wave configuration (Options 014, UNL, 016, 080, 081, H11)

1. Source attenuator for E8362/3/4B is 60 dB in 10 dB steps. Source attenuator for E8361A is 50 dB in 10 dB steps.

2. Receiver attenuator for E8362/3/4B is 35 dB in 5 dB steps. Receiver attenuator for E8361A is 50 dB in 10 dB steps.

## **Ordering guide for PNA series**

### **Network analyzers**

This guide is intended to assist you in the ordering process. For detailed ordering information, refer to the *PNA Series Microwave Network Analyzer Configuration Guide* (literature number 5988-7989EN).

#### PNA Series microwave network analyzers<sup>1</sup>

10 MHz to 20 GHz
10 MHz to 40 GHz
10 MHz to 50 GHz
10 MHz to 67 GHz

#### Options

the correct item number to order is E8362A-010.

#### Warranty and service

One and three year warranty and service plans are available at the time of instrument purchase. The N5250A microwave 110 GHz system carries a full one-year on-site warranty (where available).

#### Calibration

Three year calibration plans are available at time of instrument purchase.

<sup>1.</sup> Not all models are available in all countries.

<sup>2.</sup> E8361AH11 enables E8361A to cover 10 MHz to 110 GHz frequency range.

<sup>3.</sup> External test set must be connected.

# Test port cable specifications

	Connector Type (Test port to device)	Frequency (GHz)	Length <sup>2</sup> cm (inch)	Return Ioss	Insertion loss (dB) (f in GHz)	Stabillty <sup>1,2</sup> ±magnitude	±Phase (degrees)
Single cables for 8719 and 8720 (3.5 mm)							
85131C semi-rigid cable	3.5 mm <sup>3</sup> to PSC-3.5 mm (f)	DC to 26.5	81 (32)	≥17 dB	0.43 √f +0.3 (2.5 dB at f <sub>max</sub> )	<0.06 dB	0.16 (f) +0.5
85131E flexible cable	3.5 mm <sup>3</sup> to PSC-3.5 mm (f)	DC to 26.5	96.5 (38)	≥16 dB	$(2.1 \text{ d} D \text{ at } f_{\text{max}})$ 0.35 $\sqrt{f}$ +0.3 (2.1 dB at $f_{\text{max}}$ )	<0.22 dB	0.16 (f) +0.8
85132C semi-rigid cable	$3.5 \text{ mm}^3$ to 7 mm	DC to 18	81 (32)	≥17 dB	$(2.1 \text{ dB at } f_{\text{max}})$ 0.35 $\sqrt{f}$ +0.3 (1.8 dB at $f_{\text{max}}$ )	<0.06 dB	0.16 (f) +0.5
85132E flexible cable	3.5 mm <sup>3</sup> to 7 mm	DC to 18	97.2 (38.25)	≥17 dB	0 35 √f +0.3 (1.8 dB at f <sub>max</sub> )	<0.22 dB	0.16 (f) +0.8
Cable sets for 8719 and 8720 (3.5 mm)							
85131D semi-rigid cable set	3.5mm <sup>3</sup> to PSC-3.5 mm (f) or 3.5 mm (m)	DC to 26.5	53 (21)	≥16 dB	0.30 √f +0.2 (1.8 dB at f <sub>max</sub> )	<0.06 dB	0.16 (f) +0.5
85131F flexible cable set	3.5 mm <sup>3</sup> to PSC-3.5 mm (f) or 3.5 mm (m)	DC to 26.5	53 (21)	≥16 dB	0.25 √f +0.2 (1.5 dB at f <sub>max</sub> )	<0.12 dB	0.13 (f) +0.5
85132D semi-rigid cable set	3.5 mm <sup>3</sup> to 7 mm	DC to 18	53 (21 )	≥17 dB	0.25 √f +0.2 (1.3 dB at f <sub>max</sub> )	<0.06 dB	0.16 (f) +0.5
85132F flexible cable set	3.5 mm <sup>3</sup> to 7 mm	DC to 18	53 (21)	≥17 dB	0.25 √f +0.2 (1.3 dB at f <sub>max</sub> )	<0.12 dB	0.13 (f) +0.5
Single cables for 8722 (2.4 mm)							
85133C semi-rigid cable	2.4 mm³ to PSC-2.4 mm (f)	DC to 50	81 (32)	≥15 dB	0.84 √f +0.3 (5.6 dB at f <sub>max</sub> )	<0.06 dB	0.18 (f)
85133E flexible cable	2.4 mm <sup>3</sup> to PSC-2.4 mm (f)	DC to 50	113 (44)	≥12.5 dB	0.58 √f +0.35 (4.45 dB at f <sub>max</sub> )	<0.25 dB	0.8 +0.16 (f)
85134C semi-rigid cable	2.4 mm <sup>3</sup> to PSC-3.5 mm (f)	DC to 26.5	81 (32)	≥16 dB	0.46 √f +0.3 (2.7 dB at f <sub>max</sub> )	<0.06 dB	0.18 (f)
85134E flexible cable	2.4 mm <sup>3</sup> to PSC-3.5 mm (f)	DC to 26.5	97.2 (38.25)	≥16 dB	0.46 √f +0.3 (2.7 dB at f <sub>max</sub> )	<0.22 dB	0.16 (f) +0.8
85135C semi-rigid cable	$2.4 \text{ mm}^3 \text{ to } 7 \text{ mm}^3$	DC to 18	81 (32)	≥17 dB	$(2.7 \text{ dB at } f_{\text{max}})$ 0.46 $\sqrt{f}$ +0.3 (2.25 dB at $f_{\text{max}}$ )	<0.06 dB	0.18 (f)
85135E flexible cable	2.4 mm <sup>3</sup> to 7 mm	DC to 18	97.2 (38.25)	≥17 dB	(2.25 dB at f <sub>max</sub> ) 0.46 √f +0.3 (2.25 dB at f <sub>max</sub> )	<0.22 dB	0.16 (f) +0.8

Phase stability of semi-rigid/flexible cables is specified with a 90-degree bend and a 4"/3" radius.
 Cable length and stability are supplemental characteristics.
 Special rugged female connector specifically for connecting to the network analyzer test port. Does not mate with a standard male connector.

## Test port cable specifications continued

	Connector Type (Test port to device)	Frequency (GHz)	Length <sup>2</sup> cm (inch)	Return Ioss	Insertion loss (dB) (f in GHz)	Stabillty <sup>1,2</sup> ±magnitude	±Phase (degrees)
Cable sets for 8722D (2.4 mm)							
85133D semi-rigid cable set	2.4 mm <sup>3</sup> to PSC-2.4 mm (f) or 2.4 mm (m)	DC to 50	53 (21 )	≥15 dB	0.55 √f +0.2 (3.7 dB at f <sub>max</sub> )	<0.06 dB	0.16 (f)
85133F flexible cable set	2.4 mm <sup>3</sup> to PSC-2.4 mm (f) or 2.4 mm (m)	DC to 50	72 (28)	≥12.5 dB	0.48 √f +0.25 (3.64 dB at f <sub>max</sub> )	<0.17 dB	0.8 + 0.16 (f)
85134D semi-rigid cable set	2.4 mm <sup>3</sup> to PSC-3.5 mm (f) or 3.5 mm (m)	DC to 26.5	53 (21)	≥16 dB	0.31 √f +0.2 (1.8 dB at f <sub>max</sub> )	<0.06 dB	0.18 (f)
85134F flexible cable set	2.4 mm <sup>3</sup> to PSC-3.5 mm (f) or 3.5 mm (m)	DC to 26.5	53 (21)	≥16 dB	0.31 √f +0.2 (1.8B dB at f <sub>max</sub> )	<0.12 dB	0.13 (f) +0.5
85135D semi-rigid cable set	2.4 mm <sup>3</sup> to 7mm	DC to 18	53 (21)	≥17 dB	0.31 √f +0.2 (1.5 dB at f <sub>max</sub> )	<0.06 dB	0.18 (f)
85135F flexible cable set	2.4 mm <sup>3</sup> to 7 mm	DC to 18	62.9 (24.75)	≥17 dB	0.31 √f +0.2 (1.5 dB at f <sub>max</sub> )	<0.12 dB	0.13 (f) +0.5
Single cable for PNA (1.85 mm)							
N4697E flexible cable	1.85 mm <sup>3</sup> to 1.85 mm (f)	DC to 67	96.5 (38)	≥15 dB	1.9 dB/ft at 65 GHz	<0.1 dB	<0.5° (f) + 0.09°
Cable set for PNA (1.85 mm)							
N4697F flexible cable	1.85 mm <sup>3</sup> to 1.85 mm (f)	DC to 67	72 (28)	≥15 dB	1.9 dB/ft at 65 GHz	<0.06 dB	<0.5° (f) + 0.04°

Phase stability of semi-rigid/flexible cables is specified with a 90-degree bend and a 4"/3" radius.
 Cable length and stability are supplemental characteristics.
 Special rugged female connector specifically for connecting to the network analyzer test port. Does not mate with a standard male connector.

### Agilent Email Updates

www.agilent.com/find/emailupdates Get the latest information on the products and applications you select.

### www.agilent.com/find/agilentdirect

Quickly choose and use your test equipment solutions with confidence.

#### www.agilent.com/find/open

Agilent Open simplifies the process of connecting and programming test systems to help engineers design, validate and manufacture electronic products. Agilent offers open connectivity for a broad range of system-ready instruments, open industry software, PC-standard I/O and global support, which are combined to more easily integrate test system development.

### **Remove all doubt**

Our repair and calibration services will get your equipment back to you, performing like new, when promised. You will get full value out of your Agilent equipment throughout its lifetime. Your equipment will be serviced by Agilent-trained technicians using the latest factory calibration procedures, automated repair diagnostics and genuine parts. You will always have the utmost confidence in your measurements.

Agilent offers a wide range of additional expert test and measurement services for your equipment, including initial start-up assistance onsite education and training, as well as design, system integration, and project management.
