

Minimising Trade-offs and Conflicts in Nature-based Solutions: An Investigation of Value Pluralism in Nature Credit Markets

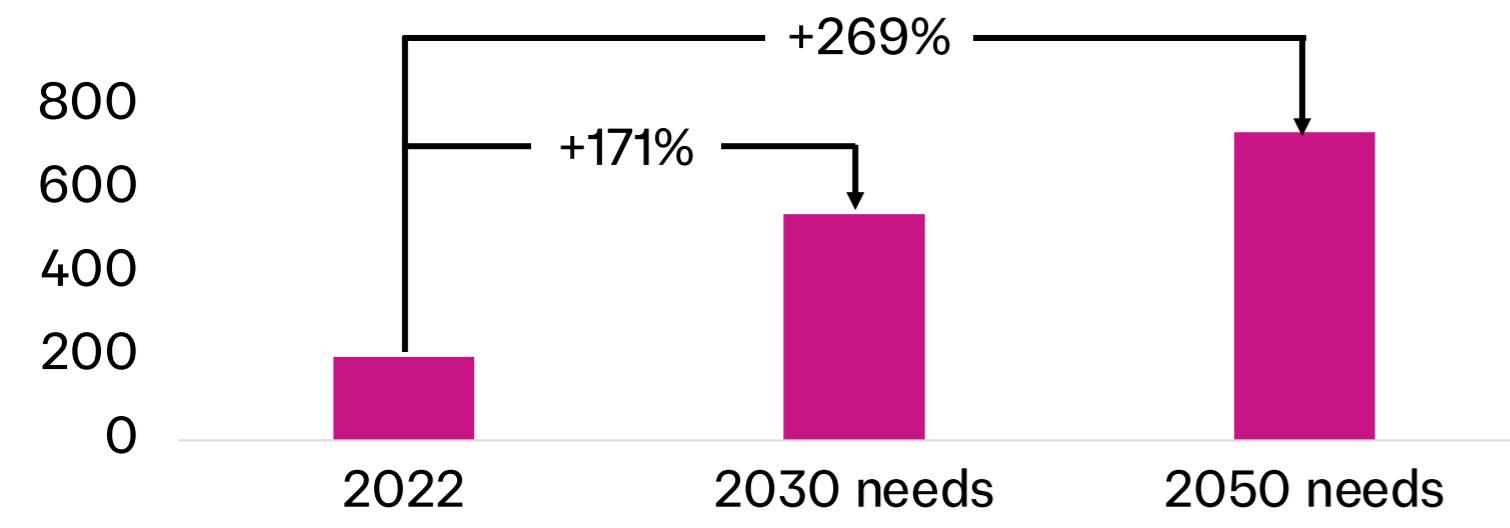

Gail Sucharitakul, PhD Researcher

Dr. Caroline Howe, Senior Lecturer

Centre for Environmental Policy,
Imperial College London

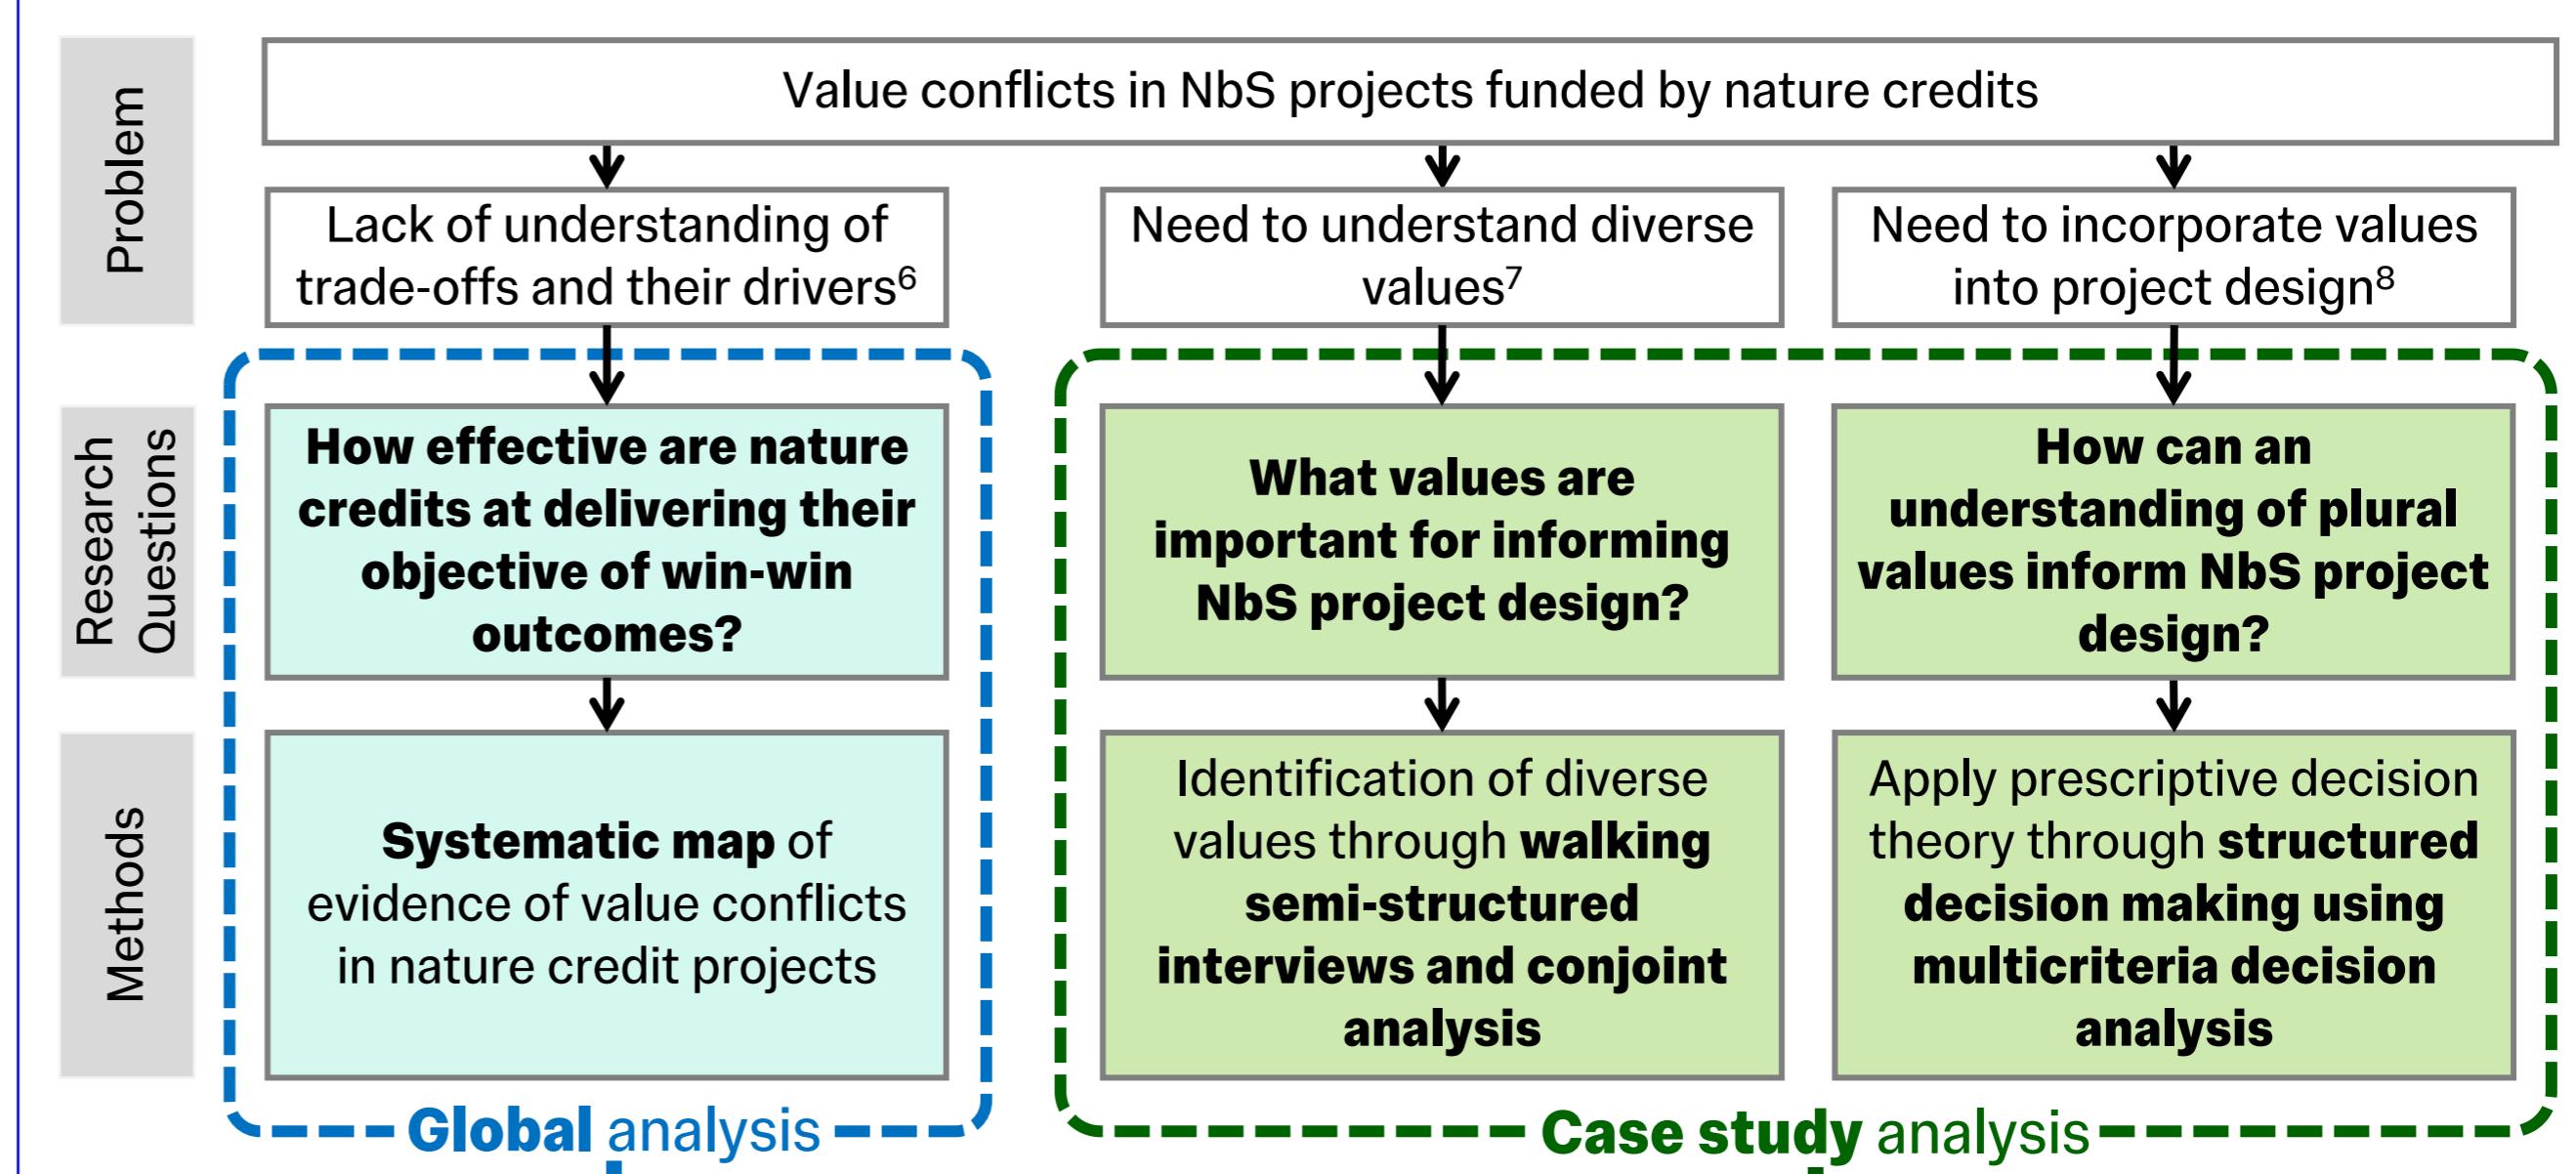

1. Introduction

NbS investment needs to meet Rio targets¹
(USD billion per annum)

- Nature-based Solutions (NbS) are **underfunded¹**
- Voluntary nature credits are a key mechanism to increase **private finance²**, which represents ~20% of NbS finance¹
- **Voluntary nature credits are controversial** and have faced integrity issues, resulting in decreased finance for NbS³
- A key issue for nature credits is **conflicting values⁴**, resulting in inequitable trade-offs⁵

2. Problem identification and methods

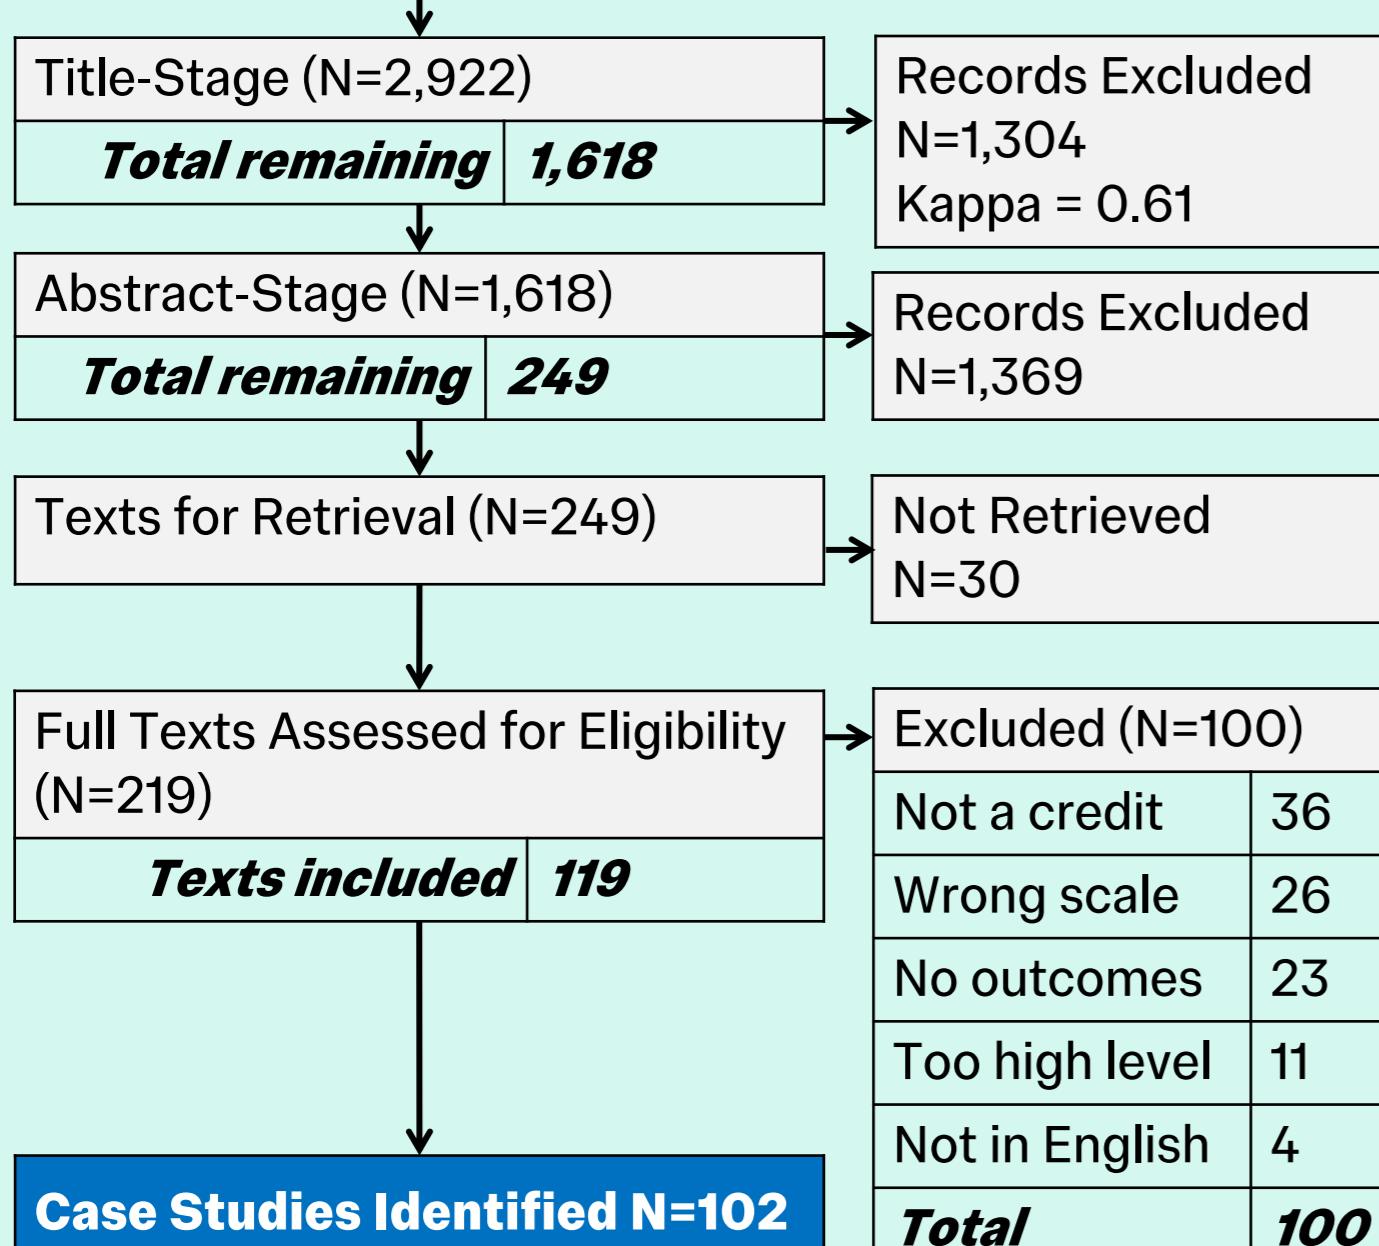

3. Global analysis: Systematic map

Inclusion criteria (PICO framework):

- Population: NbS projects
- Intervention: Financing through voluntary nature credits
- Comparator: Private vs. public funding
- Outcome: Win-win or trade-off outcome

Academic Record Search (N=4,503)	
Google Scholar	300
SCOPUS	2,352

Duplicates	-1,581
Total remaining	2,922

Data coding (in progress):

- Meta-data: bibliographic information, project attributes (e.g., location, funding, intervention type)
- International Union for Conservation of Nature (IUCN) NbS Standard societal challenges⁹
- Intergovernmental Science-Policy Platform on Biodiversity and Ecosystem Services (IPBES) values typology¹⁰

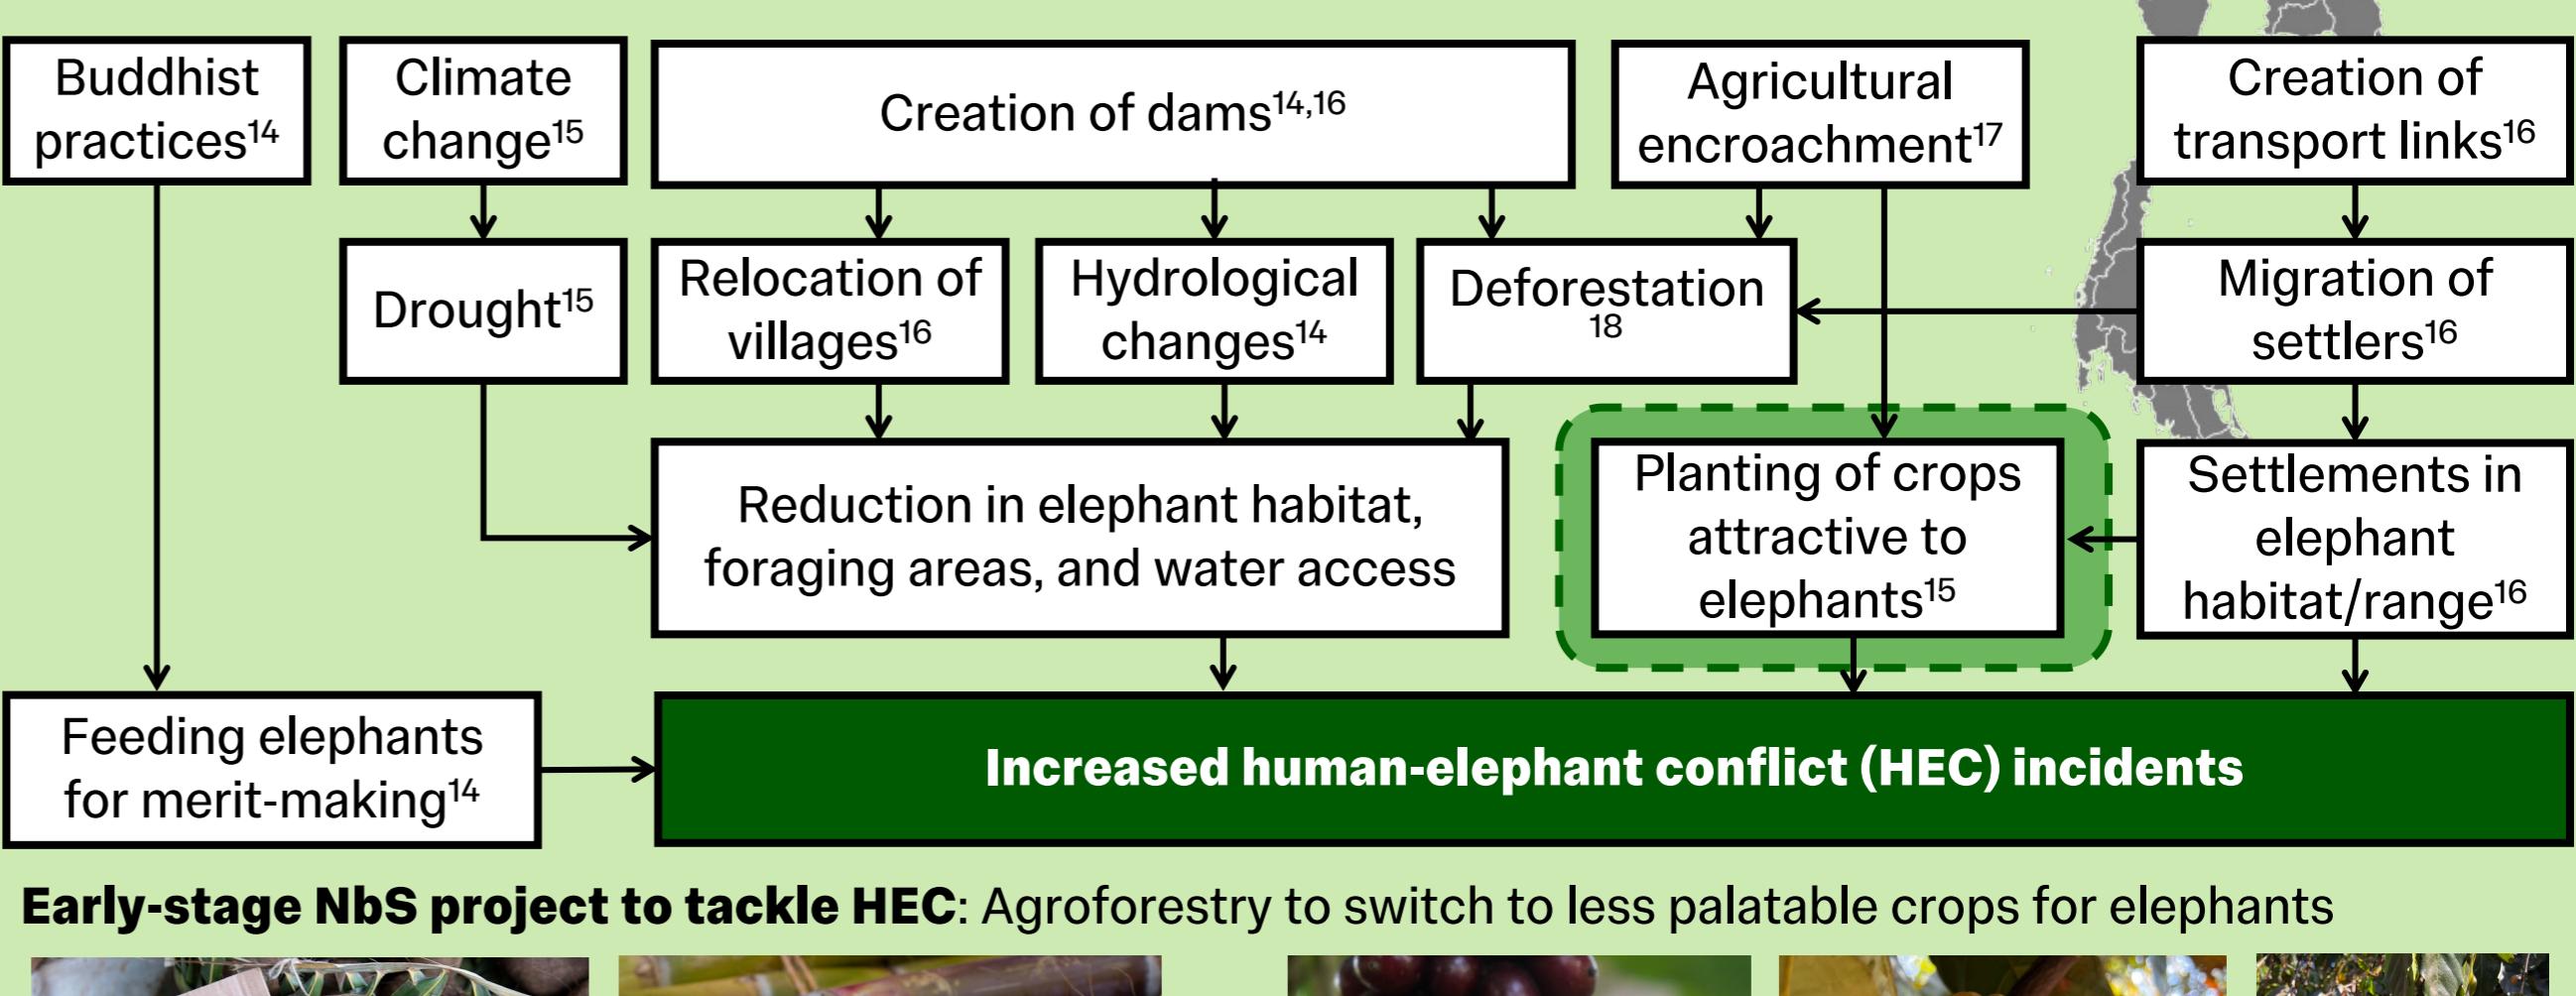

4. Local analysis: Fieldwork

Context: Human-elephant conflict in the Western Forest Complex (WEFCOM), Thailand

- WEFCOM = 18,000 km², the largest remaining forest tract in mainland SE Asia¹¹
- ~250-300+ elephants in southern WEFCOM, ~20% of the total Thai population¹²
- 195 human deaths and 167 injuries due to wild elephants in Thailand since 2018¹³

Insights from scoping visit, conducted in January 2025

Early-stage NbS project to tackle HEC: Agroforestry to switch to less palatable crops for elephants

How to design and finance the NbS project? Structured Decision Making (SDM)

Phase 1: Value elicitation

- **Scoping visit** identified diversity of values amongst migrant farmers, Indigenous communities, NGOs, Government, and the private sector
- **Walking semi-structured interviews** to map values
- **Conjoint analysis** to rank and identify which values are most important for NbS

Phase 2: Spatial multicriteria decision analysis (illustrative)

- Identifying relative importance weighting of criteria
- Modelling performance of criteria for all alternatives
- Aggregating importance + performance = preference

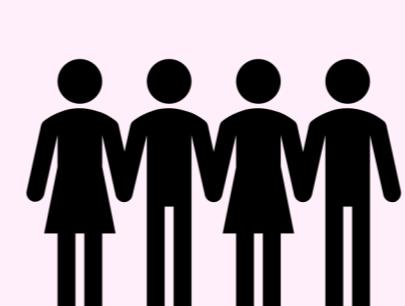

Criteria	BAU	Carbon Credits	Biodiversity Credits
Increase farmer income	●	●	●
Meet investors' hurdle rate	●	●	●
Reduce human-elephant conflict	●	●	●
Increase biodiversity	●	●	●
Increase carbon sequestration	●	●	●
Increase climate resilience	●	●	●

● Likely ● Medium probability ● Low probability ● Unknown

5. Research contributions

Develop **unbiased summary** of the evidence

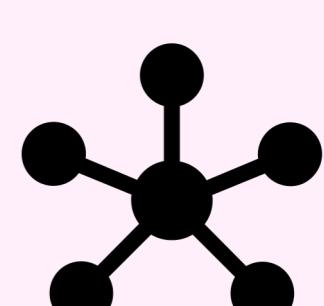

Demonstrate **value pluralism in practice**

Inform the design of a real-world NbS project

Develop **recommendations** to improve NbS design

Apply **nexus governance** approaches
