### Learning and teaching

#### Module description

#### Learning outcomes

On completion of this module you will be able to:

- recognise a range of optical phenomena and their fundamental origins, and understand their significance in the operation of, and/or the limitations they impose in, optical instrumentation
- use state of the art optical measurement techniques, optical instruments and components
- construct detailed optical instrumentation from simpler components to address specific optical measuremnts
- crtically analyse the results of measurements made during experiments, taking account of errors.
- model extended optical experiments using your own computer programmes or through dedicated software
- Keep a laboratory record
- Produce written reports in a variety of scientific formats

#### Module content

The module will contain practical work related to

- a range of optical phenomena incuding: refraction, diffraction, interference, dispersion, polarisation, imaging;
- making use of of optical components including: lasers, optical fibres, detectors, cameras, lenses. mirrors, diffraction gratings;
- using optical methods:spectrometers, interferometers, computer modelling.

#### Learning and Teaching Approach

The module consists of 2 sections.

- 1. **Demonstration Experiments**: Students will follow 15 different demonstration experiments, each completed in a single 3 hour session. A complete laboratory script will be provided for the experiment and students will be required to keep a lab-record of their progress together with results, their analysis and conclusions.
- 2. **Standard Experiments**: Students will choose 4 standard experiments that are each completed over four 3 hour laboratory sessions usually spaced out over a week. A script will be provided for the experiment, but students will be encouraged to explore the material in greater depth than in the Demonstration experiments. Students will also keep a record of their experiment in a lab-record and in addition, for each experiment, produce a written report on their work in the lab in the form of a scientific report. A variety of scientific report formats will be used reflecting those used in academic or industrial contexts.

Throughout the lab students will be supported by laboratory instructors who will be able to provide help and advice on the experiments that they are undertaking as well as how to keep a suitable lab-record.

Assessment	Throughout the laboratory module formative assessment will be provided by the laboratory demonstrators on					
Strategy	lab record keeping and for general understanding of the physical phenomena being investigated.					
	Students must complete the <b>demonstration experiments</b> . During the <b>demonstration experiments</b> students					
	keep a lab-record of their work. There is no summative assessment as these experiments are primarily aimed					
	at ensuring that students are introduced to key phenomena and techniques and understand the importance of,					
	and develop good skills in keeping a complete, accurate and up-to-date lab-record. To reinforce this and as a					
	record of their completion of each experiment, students will be required to submit their lab-record at the end of					
	each laboratory session during the demonstration experiments.					
	Standard Experiments are assessed through written reports and will be marked for summative and formative					
	assessment. Students write reports for each of the 4 experiments undertaken, in a range of formats which are					
	appropriate to professional scientific communications: 2 experiments will be assessed by a 2-page conference					
	abstract, 1 experiment will be assessed by a 10-page formal laboratory report, and 1 experiment will be					
	assessed by a 4-page journal style report based on the Optics Letters template. Each report has equal					
	weighting.					
	weighting.					
	The aim through all of the laboratory assessment is to assess that the physics being studied has been					
	understood, that appropriate scientific methods have been used and that reports are being written in an					
	appropriate scientific format.					
Feedback	Feedback will be given by instructors during laboratory sessions on physical understanding and laboratory					
i eeuback	record keeping.					
	Written feedback will be provided on the submitted written reports to highlight particular areas of understanding,					
	formatting and style.					
	Verbal feedback will be provided for the proposal stage of the system design to help students develop their					
	projects in a successful and timely manner.
