

Overview of Workshop 1: Strategies and Energy Research Needs

Matthew Hannon, Research Associate, RCEP Energy Strategy Fellowship

13th November 2012

Imperial College

Introduction to *Energy Strategies and Energy Research Needs* Workshop

Purpose of workshop

'To draw upon insights from a range of expert stakeholders to identify the UK's current energy related research capabilities and its future energy research needs'

Structure of workshop – Split into 3 parts

- 1. A review of approaches to energy futures followed by a plenary
- 2. Facilitated session on the range of possible UK energy futures
- 3. Breakout session on energy research portfolios

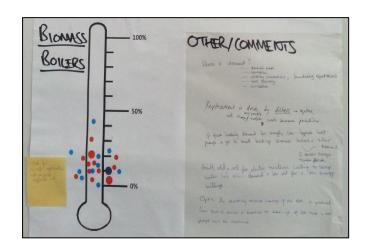

Make-up of workshop

 25 workshop attendees from a range of sectors and different energy related professional backgrounds

Breakout Session 1: UK Energy Futures

Structure of Breakout Session 1

- Examined the market share of specific energy technologies in the UK for:
 - a) Electricity Supply
 - b) Heating
 - c) Vehicle Transportation
 - d) Energy Demand
 - e) Disruptive Technologies and Scenarios
- a c: Several common technologies were identified and presented as thermometers. Blue and red sticky dots represented people's preferred and expected market share by 2050
- *d*: higher or lower energy demand than today's?
- e: low, medium or high disruptive capacity?
- Comments encouraged!

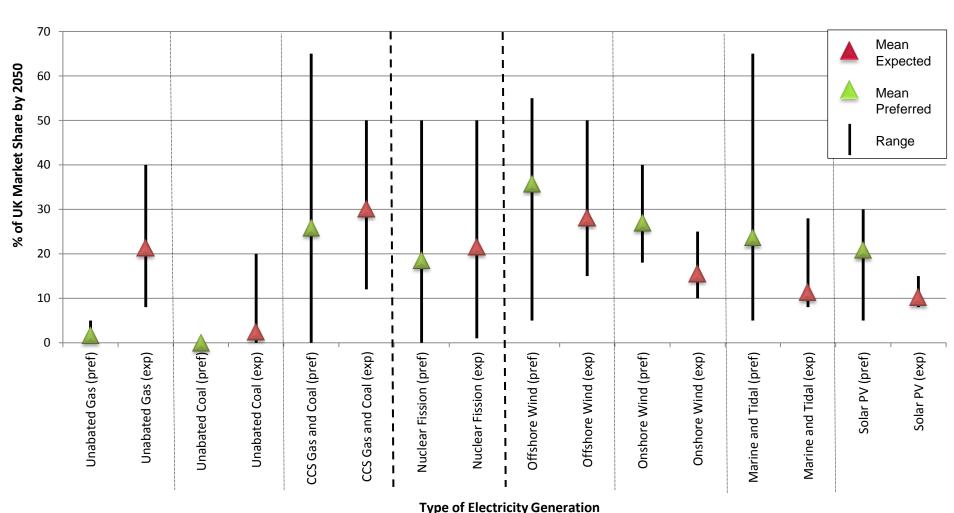

Results from Breakout Session 1

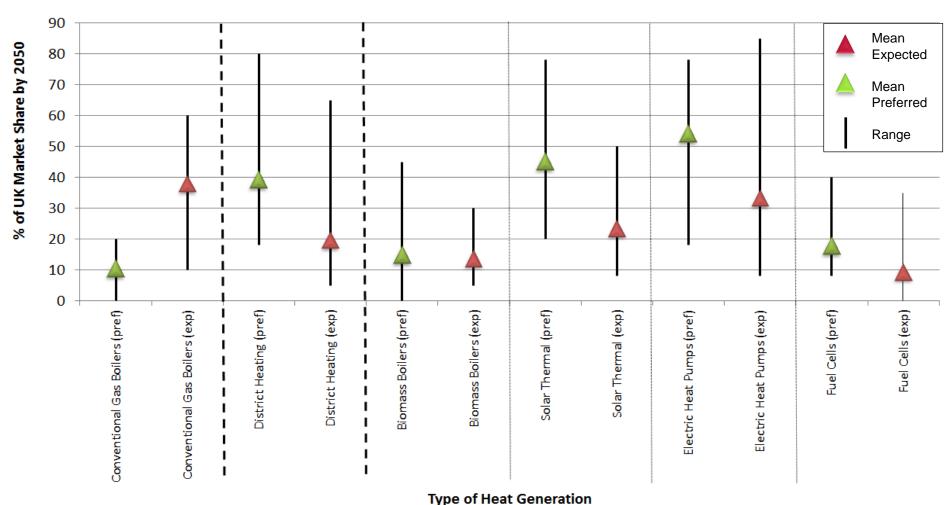

UK Electricity Supply Technology Market Share by 2050

Results from Breakout Session 1

Results from Breakout Session 1

Disruptive Technologies and Scenarios

- Smart meters, load shifting and smart business models could be very disruptive e.g. consumer participation in the energy market, demand-side response facilities, new ways to pay for energy etc
- Distant but potentially disruptive technologies e.g. synthesis of natural gas from CO2 and H2
- Self-driving vehicles, currently being trialled by Google, could drastically change transportation usage patterns
- We still have potentially 200 years of fossil fuels in the UK from underground coal gasification!

Key Emergent Theme

 Attendees had 'bought into' the vision of a low-carbon economy but were generally pessimistic about how realistic this vision is

Breakout Session 2: UK's Energy R & D Portfolio

Structure of Breakout Session 2

- Attendees split into 5 groups of approximately 4 to 5 people
- Each group was paired with a facilitator
- Groups were supplied with a consolidated version of the IEA's energy R & D nomenclature, which acted as an aide memoire
- Groups were asked to consider each category in terms of:

Scientific capability – The UK's capabilities with respect to research; applied research and development; and demonstration

Industrial capability – The UK's capabilities with respect to the deployment and commercialisation of the products of R&D, such as technologies, processes, services etc

Relevance to UK's Energy Future – How relevant the technology is in terms of meeting the UK's energy policy goals relating to climate change, energy security and affordability

Breakout Session 2: UK's Energy R & D Portfolio

- Groups presented their majority verdict for each R & D category
- Recorded on worksheet in form of colour-coded post-it notes (see picture)
- According to their position, the categories were assigned a value of between 1 - 100
- Industrial Capability Groups given the option of assigning categories a value of 'no clear international lead'

Imperial College London

Results from Breakout Session 2

Key Findings from Breakout Session 2

Broader Findings

- A strong divergence across the groups relating to UK's scientific and industrial capabilities for different R & D categories. Also, their relevance
- Industrial and scientific capabilities likely to radically change between now and 2050. May improve or deteriorate with time
- UK considered to lead in certain 'pockets' of energy related R & D but not believed to be strong across the board
- External factors (e.g. climate change, market reform etc) thought to significantly influence UK's energy R & D portfolio: not merely a product of design but one of broader landscape changes
- Despite technological focus of session, attendees emphasized importance of social sciences to UK's energy future e.g. socio-technical analysis

Relevance of Workshop 1 to Workshop 2

- Workshop 1 focused on where we are now in terms of energy R & D and how things are likely to develop leading up to 2050
- In the context of the UK's current research capabilities and future energy needs, Workshop 2 primarily seeks to identify:
 - How insights from scientific disciplines outside the classic science and engineering (EPSRC) domain might contribute to present and future UK energy research
 - 2. How these different disciplines might work in conjunction with one another
 - 3. How we might design research that draws upon a wide range of disciplines and research styles
