

Data Center Grid Integration & the Case of Ireland

Eamonn Lannoye

EPRI Europe
Sept 9th 2025

Snapshot

- 49 Committed Members & continued interest...
 - + Across 4 regions & 5 industry sectors
- Foundational Deliverables & ongoing engagement
 - + 5 published, 2 in final review, many on the way
 - + 3 Regulatory, Policy, and Technology Trends Digests released
 - + Launched WS4: Data Center Informed Energy Supply
- Continued External Presence

get punched in the mouth.” -
Mike Tyson**

Hard Fought New Tech Playbook

Adequacy

Congestion

Dispatch

Code compliance

After being relatively flat for decades, electricity use is growing again

Selected Recent Utility and ISO/RTO
Load Forecast Projections

| Company | Current Peak | Future Peak | % Increase | Forecast Source |
|---------------|--------------|----------------|------------|------------------------|
| ERCOT | 85 GW | 152 GW (2028) | 79% | April 2024 Legislation |
| Dominion | 22 GW | 33.5 GW (2030) | 53% | PJM 2024 Load Forecast |
| Georgia Power | 15 GW | 21.6 GW (2030) | 44% | 2023 IRP Revision |
| APS | 8 GW | 9.8GW (2030) | 23% | 2023 IRP |
| Duke | 31.7 GW | 36 GW (2030) | 14% | 2023 IRP |

Data Center and industry growth faster than supply and delivery buildout, requiring new strategies

Load Composition Ireland

~21% electricity demand by DCs

Final Consumption - Electricity (ktoe)
By Sector

C&I
~64%

Units:

Final Consumption - Information & Communication (ktoe)
By Energy Product (Excludes Non-Energy Sub-Products)

Adequacy

Materiality

Material:

would require new capacity investment, combined with other load growth

Highly Material:

would require capacity investment alone

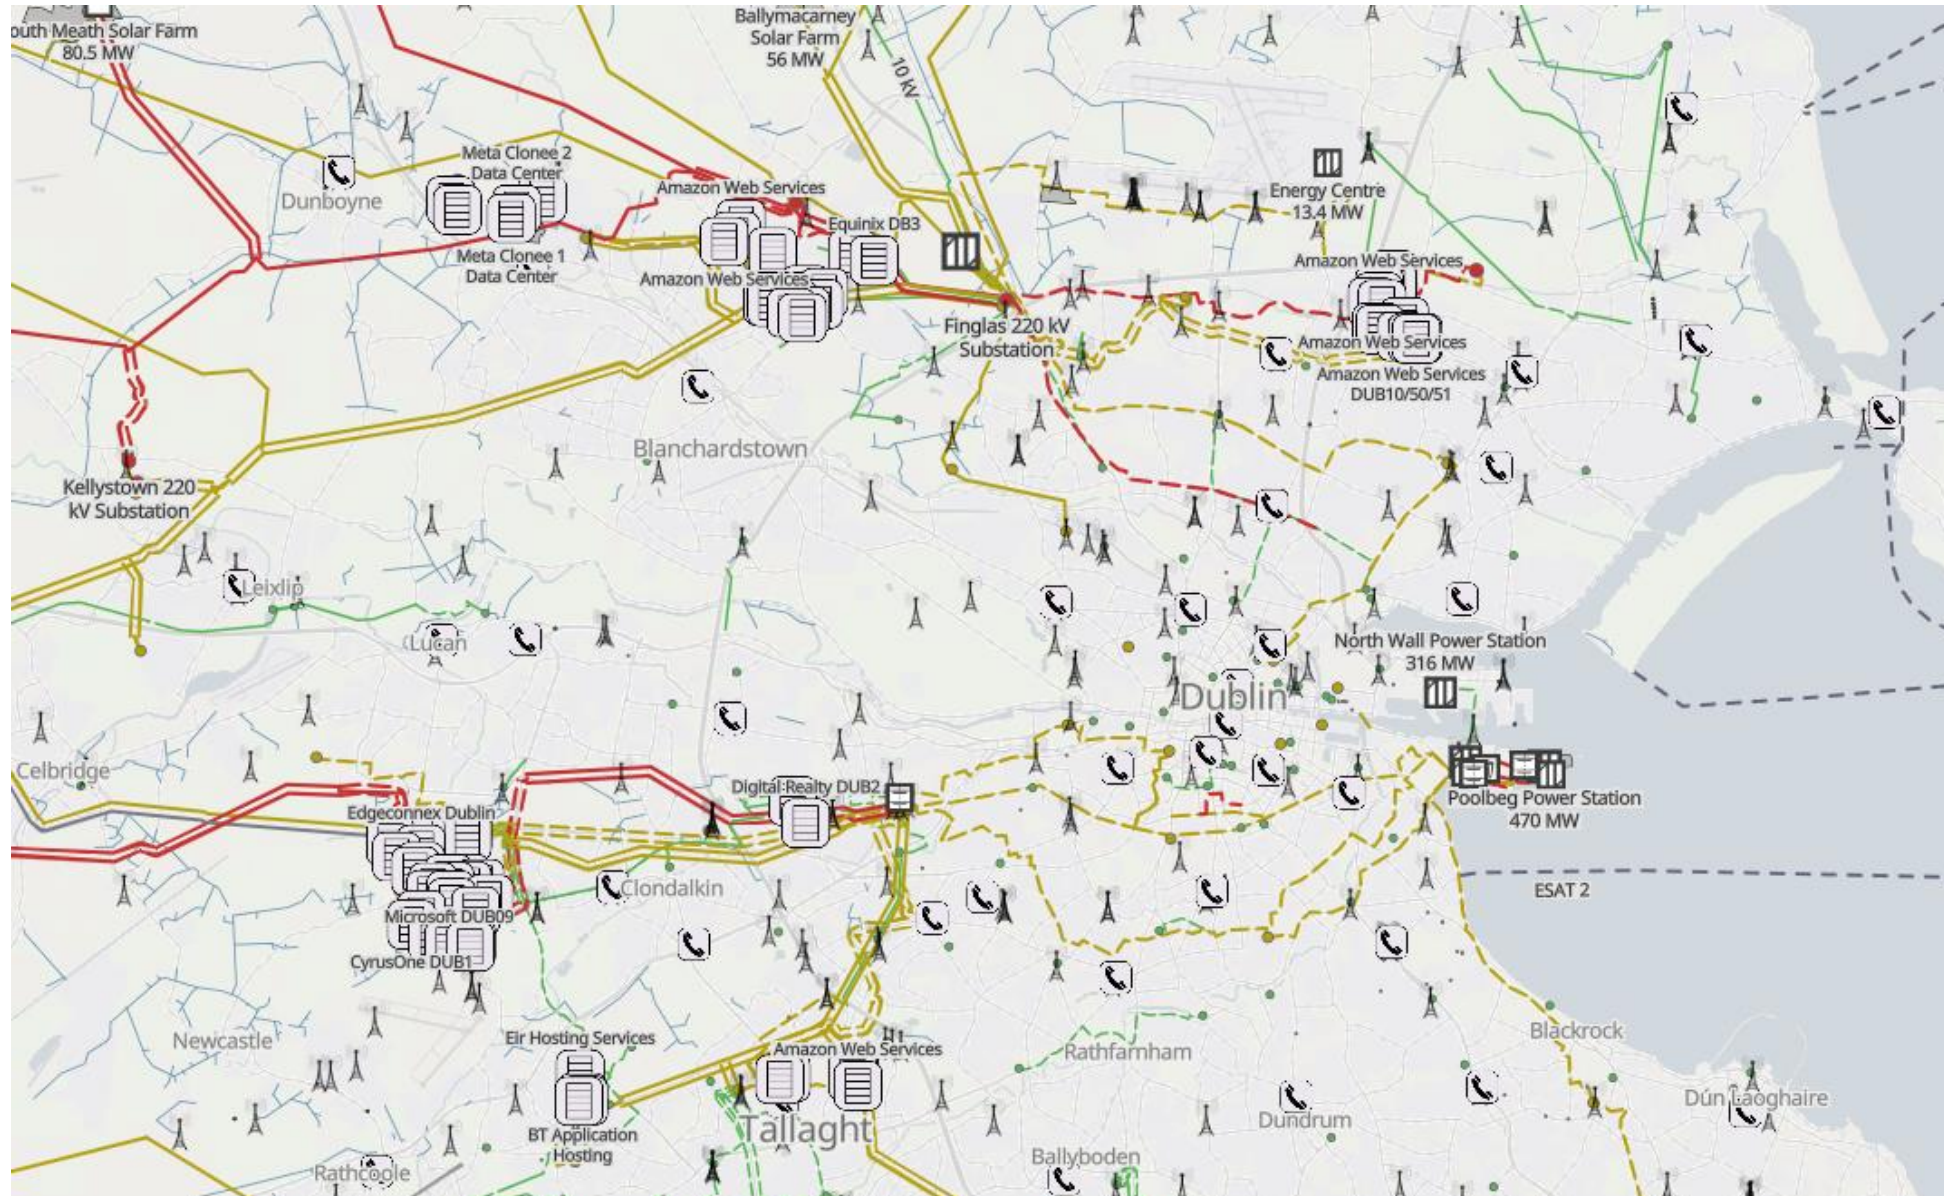

Irish Experience

- 20%+ load served
- Moratorium on new connections
- Capacity auctions binding

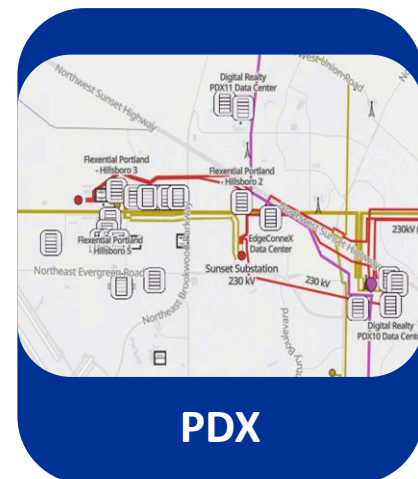

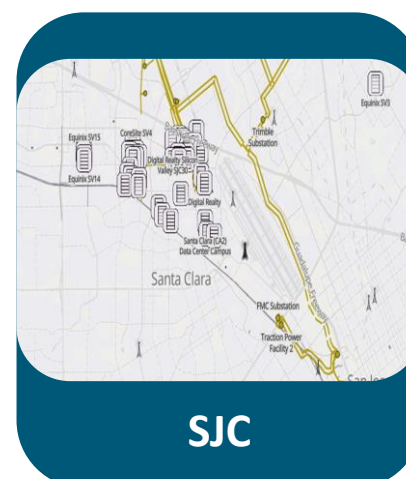

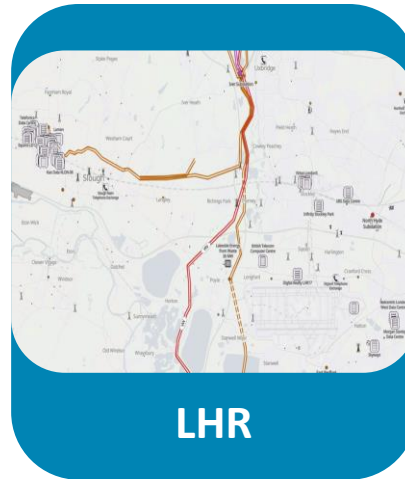

DCFlex Research

- How to anticipate the load profile
- Flexibility to address stress events
- Improved understanding of adequacy
- Energy supply resource delivery

Location Clusters

Global Clusters examples

Congestion

Materiality

Material:

Requires shallow
grid reinforcement

Highly Material:

Requires deep grid
reinforcement

Irish Experience

- Data centers located in T50 belt outside Dublin (national load center)
- Redispatch handled by EirGrid though redispatch actions
- Deep grid reinforcement required to grow load in East
- Limited ability to refer load west

DCFlex Research

- Flexibility for congestion relief
- Co-location models & designs
- Transmission hosting capacity study processes

Conceptual Proposal

DC Design & Constraints

| | | |
|---|-------------------------|-------|
|  | Computing Power | 50 MW |
|  | Backup Generation (UPS) | 10 MW |
|  | Onsite PV | 5 MW |
|  | Onsite Wind | 2 MW |
|  | Onsite BESS | 6 MW |
|  | Grid Connection | 40 MW |
|  | Cooling System | 15 MW |

StarFlex

Data Center Design #3

Overall Rating ★★★★★

- ✓ Forced Outage Shock
- ✓ High Congestion Alleviation
- ✓ Prolonged Dark Doldrum
- ✓ Low Renewable Ramp-Up

Components

| | | |
|---|--|---|
|  Computing Power 10 MW |  Backup Generation (UPS) 6 MW |  Onsite PV 4 MW |
|  Onsite Wind 2 MW |  Onsite BESS 5 MW |  Grid Connection 20 MW |

Recommendations

- Increase onsite PV capacity
- Increase onsite BESS power capacity
- Increase backup generation (UPS) capacity

Grid Flexibility

Tests

FREQUENCY EXCURSION

TRANSMISSION LOSS

HIGH CONGESTION ALLEVIATION

PROLONGED DARK DOLDRUM

DUCK CURVE

INTRA-DAY BALANCING

Dispatch

Materiality

Material:

Technology engages actively in the market, sets price

Highly Material:

Technology sets stress prices, requires specific representation

Irish Experience

- Prices high relative to Europe
- Negative pricing lower than otherwise would have been
- PPA market influenced by DC customers
- BTM resources used as demand response and for system services

DCFlex Research

- Load participation program & tariff design
- Demonstrations of behind the meter resource usage
- Flexibility to provide system services

Demonstration Selection Update

8 projects proposed, 3 confirmed

Load Flexibility (AI)

| | |
|------------------|----------------------------|
| Location: | Phoenix, AZ |
| Demo: | IT Workload Flexibility |
| Utility: | APS, SRP |
| Partners: | Emerald AI, NVIDIA, Oracle |

Load Flexibility

| | |
|------------------|-------------------------|
| Location: | Lenoir, NC |
| Demo: | IT Workload Flexibility |
| Utility: | Duke Energy |
| Partners: | Google |

Power Quality

| | |
|------------------|----------------------------|
| Location: | Paris, France |
| Demo: | PQ Fault Ride-Through |
| Utility: | RTE |
| Partners: | Schneider Electric, Data 4 |

Codes

Materiality

Material:

Impact requiring settings based intervention

Highly Material:

Significant risk requiring operational intervention

Irish Experience

- Issues noted with respect to fault ride through during close in faults
- Consequential loss secured against in operations
- Grid code modification proposal under development

DCFlex Research

- Modeling for DCs
- Fault ride through strategies for DCs
- Demonstrations of FRT capability
- Power quality monitoring and interventions
