

MEng Aeronautical Engineering with a Year Abroad

This document provides a definitive record of the main features of the programme and the learning outcomes that a typical student may reasonably be expected to achieve and demonstrate if s/he takes full advantage of the learning opportunities provided. This programme specification is intended as a reference point for prospective students, current students, external examiners and academic and support staff involved in delivering the programme and enabling student development and achievement.

Programme Information

Programme Title	Aeronautical Engineering with a Year Abroad		
Award(s)	MEng		
Programme code	H410		
Awarding Institution	Imperial College London		
Teaching Institution	Imperial College London		
Faculty	Faculty of Engineering		
Department	Department of Aeronautics		
Associateship	City and Guilds of London Institute (ACGI)		
Main Location of Study	South Kensington Campus		
Mode and Period of Study	4 academic years full-time		
Cohort Entry Points	Annually in October		
Relevant QAA Benchmark Statement(s) and/or other external reference points	Honours Degrees in Engineering and Master's Degrees in Engineering		
Total Credits	ECTS:	240	UK Credit: 480
FHEQ Level	Level 7		
EHEA Level	2 nd cycle		
External Accrator(s)	Royal Aeronautical Society (RAeS) Accreditation received: 2015 Accreditation renewal: 2020 Institute of Mechanical Engineers (IMechE) Accreditation received: 2015 Accreditation renewal: 2020		
Specification Details			
Student cohorts covered by specification	2016/17 entry to 2018/19 entry		

Person responsible for the specification	Dr Errikos Levis, Director of Undergraduate Studies
Date of introduction of programme	N/A
Date of programme specification/revision	October 2019

Programme Overview

The Department of Aeronautics aims to provide a course that trains and prepares the future leaders in aeronautics and related engineering disciplines, in a program that ranks as the top aeronautics course in the UK and one of the best World-wide. This is done through an integrated programme of study wherein the specific engineering disciplines are learnt from the first week of the first year; we strongly believe that this is the most appropriate approach to train highly-competitive engineers in the 21st century, and as such the degree programme does not include a *general* engineering foundation.

We also aim to graduate students of the highest quality, who will not only demonstrate technical and professional leadership in their fields, but who are adaptable and therefore well-suited to careers in both the industrial and service sectors. Our students must demonstrate both knowledge and skills and apply them to problems relevant to modern engineering practice in both *general* terms and in *discipline-specific* terms. Students in the MEng with a Year Abroad do also benefit from the direct international experience obtained through a year in a foreign university.

The programme aims/objectives are to:

- To provide students with a solid technical basis in all the key areas of the modern discipline-specific Engineering profession through delivery of a coherent, coordinated and balanced degree course, integrating core engineering science with practical application.
- To enable students to acquire a mature appreciation of the context in which engineering projects are developed.
- To develop in our students excellence in oral, written and graphical communication.
- To invest graduates with a fitness to enter professional practice and the capacity to have a beneficial impact upon it, whether in the industrial or service sectors generally or in the specific engineering discipline in particular.
- To develop an understanding of the physical world and of the use of mathematical abstraction to represent it.
- To develop the ability to make rational decisions.
- To develop clarity and style in professional communication.
- To develop skills of management, planning, organisation and teamwork.
- To appreciate the conceptual and creative aspects of design; to develop the ability to incorporate concepts into the design of new products or processes.
- To develop an awareness of the place of the individual in business, society and the environment.
- To develop a commitment to the public interest.
- To inculcate an understanding of professional behaviour.
- To develop the intellectual capacity and breadth of vision to remain a learner for life.

The department maintains very close contact with industry through a joint academic-industry advisory board that was specifically constituted to provide input to the structure and syllabus of the programme. Members of the board include key academics from within the department (Head of Department, Director of Undergraduate Studies, Careers Advisor plus several others) and senior members from a wide variety of UK engineering companies that are influential in the aerospace sector and that might constitute career destinations for the student cohort (Airbus, ARA, BMT Fluid Mechanics Ltd, BAE Systems, QinetiQ, Rolls-Royce, Mercedes AMG F1, Jaguar Land Rover). Detailed syllabus information is reviewed on a regular basis by the board, and, twice yearly, meetings are held at which a series of prepared papers on the state and future

direction of both industry and academia are presented and discussed. The ideas generated at these meetings are transferred back into the department via its various strategic committees.

Contact between students and industry occurs through talks and seminars, specific lecture courses, and projects. For more general talks, a number of visiting industrial speakers are invited each year to present either short lunch-time talks to all undergraduates on their experiences. For specific areas, an industrial speaker may provide a talk to add complementary material to a particular lecture course (e.g. energy and environment in propulsion). Courses in Helicopter Dynamics, Applications of Fluid Dynamics, Structural Dynamics and Design of Experiments are taught in full or in part by industry experts. Input from industry into project work is significant, where undergraduate students benefit in many cases from working with internationally leading engineering companies (normally at their sites) across a broad span of areas. This enables our students to undertake significant project work in demanding areas, either internally or on external placements, which constitutes one of the most significant drivers of our curriculum. Students in placements for a final-year project will be assigned an academic supervisor to monitor their learning experience and also to provide progress feedback and expert advice.

Learning Outcomes

Programme Learning Outcomes are listed below. The headings correspond to the UK-Spec documentation of 2008-2009. Specific Module learning outcomes can be listed within Module Handbooks, which are available online at

www.imperial.ac.uk/aeronautics/study/ug/current-students/programme-information/

Underpinning science, mathematics and associated engineering disciplines

- Knowledge and understanding of scientific principles and methodology necessary to underpin their education in their engineering discipline, to enable appreciation of its scientific and engineering context, and to support their understanding of historical, current and future developments and technologies.
- A comprehensive understanding of the scientific principles of own specialisation and related disciplines.
- Knowledge and understanding of mathematical principles necessary to underpin their education in engineering discipline and to enable them to apply mathematical methods, tools and notations proficiently in the analysis and solution of engineering problems.
- An awareness of developing technologies related to own specialisation.
- Ability to apply and integrate knowledge and understand of other engineering disciplines to support study of their own engineering discipline.
- A comprehensive knowledge and understanding of mathematical and computer models relevant to the engineering discipline, and an appreciation of their limitations.
- An understanding of concepts from a range of areas including some outside engineering, and the ability to apply them effectively in engineering projects.

Engineering Analysis

- Understanding of engineering principles and the ability to apply them to analyse key engineering processes.
- Ability to use fundamental knowledge to investigate new and emerging technologies.
- Ability to identify, classify and describe the performance of systems and components through the use of analytical methods and modelling techniques.
- Ability to apply mathematical and computer based models for solving problems in engineering, and the ability to assess the limitations of particular cases.
- Ability to apply quantitative methods and computer software relevant to the engineering discipline, in order to solve engineering problems.
- Ability to extract data pertinent to an unfamiliar problem, and apply in its solution using computer based engineering tools when appropriate.
- Understanding of and ability to apply a systems approach to engineering problems and to work with

uncertainty.

Design

- Investigate and define a problem and identify constraints including environmental and sustainability limitation, health and safety and risk assessment issues.
- Wide knowledge and comprehensive understanding of design processes and methodologies and the ability to apply and adapt them in unfamiliar situations.
- Understand customer and user needs and the importance of considerations such as aesthetics.
- Ability to generate an innovative design for products, systems, components or processes to fulfil new needs.
- Identify and manage cost drivers.
- Use creativity to establish innovative solutions.
- Ensure fitness for purpose for all aspects of the problem including production, operation, maintenance and disposal.
- Manage the design process and evaluate outcomes.

Economic, social, and environmental context

- Knowledge and understanding of commercial and economic context of engineering processes.
- Extensive knowledge and understanding of management and business practices, and their limitations, and how these may be applied appropriately.
- Knowledge of management techniques which may be used to achieve engineering objectives within that context.
- The ability to make general evaluations of commercial risks through some understanding of the basis of such risks.
- Understanding of the requirement for engineering activities to promote sustainable development.
- Awareness of the framework of relevant legal requirements governing engineering activities, including personnel, health, safety, and risk (including environmental risk).
- Understanding of the need for a high level of professional and ethical conduct in engineering.

Engineering Practice

- Knowledge of characteristics of particular materials, equipment, processes, or products.
- A thorough understanding of current practice and its limitations, and some appreciation of likely new developments.
- Workshop and laboratory skills.
- Extensive knowledge and understand of a wide range of engineering materials and components
- Understanding of contexts in which engineering knowledge can be applied (e.g. operations and management, technology development, etc).
- Ability to apply engineering techniques taking account of a range of commercial and industrial constraints.
- Understanding use of technical literature and other information sources. P5 Awareness of nature of intellectual property and contractual issues
- Awareness of appropriate codes of practice and industry standards.
- Awareness of quality issues.
- Ability to work with technical uncertainty.

Entry Requirements

Internal transfer only from H401 programme at the end of the second year. Transfer requirements can be found at:

<http://www.imperial.ac.uk/aeronautics/study/ug/current-students/year-abroad/>

The programme's competency standards document can be found at:

<http://www.imperial.ac.uk/engineering/departments/aeronautics/study/ug/current/>

Learning & Teaching Strategy					
Scheduled Learning & Teaching Methods	<ul style="list-style-type: none"> • Lectures • Tutorials • Associated Problems Sessions 				
E-learning & Blended Learning Methods	N/A				
Project and Placement Learning Methods	<ul style="list-style-type: none"> • Research Project • Industrial Internship Project 				
Assessment Strategy					
Assessment Methods	<ul style="list-style-type: none"> • Written Examinations • Coursework • Tutorial Material • Oral Presentations • Progress Reports 				
Academic Feedback Policy					
<p>Feedback is an essential part of learning and the Department gives high priority to the timeliness and quality of assessment/feedback to students on all modules. The primary purpose of feedback is to assist learning and the development of skills, by highlighting strengths and weaknesses on one hand, and by identifying actions for improvement on the other. It is important to recognize that: 1) feedback comes in various forms and 2) feedback requires student active engagement.</p> <p>The various forms of feedback we undertake are:</p> <ul style="list-style-type: none"> • Unstructured - for example, from fellow students in group work, or perhaps via dialogue with a lecturer or teacher in or outside of a tutorial, class or laboratory, or by email; • More structured - for example, via the assessment of practical, laboratory, coursework or project submissions; • Formal - via progress tests (examinable and non-examinable) or examinations. • Scheduled surgery sessions for coursework and laboratories (for 2nd 3rd/4th labs only) after marking to explain the criteria used in assessment, common errors made, where marks are lost etc. <p>Blackboard is our Virtual Learning Environment (VLE) and is used to deliver our courses. All coursework is submitted/graded and feedback-given via Blackboard. Every module has a dedicated "Feedback Forum" in BlackBoard to provide an additional space and a historical repository for Question & Answers.</p>					
Re-sit Policy

Assessment Structure

Marking Scheme

Year One

A student must:

- Achieve a mark of at least 40% in each individual examination
- Achieve an aggregate mark of at least 40% in the combined coursework assessments

Year Two

A student must:

- Achieve a mark of at least 40% in each individual examination
- Achieve an aggregate mark of at least 40% in the combined coursework assessments

Year Three

A student must:

- Achieve a mark of at least 40% in each individual core course examination
- Achieve an aggregate examination mark of at least 40%
- Achieve an aggregate mark of at least 40% in the combined coursework assessments

Year Four

A student must:

- Achieve an overall mark of at least 40%
- Achieve an aggregate mark of at least 40% in the final year project

Final Degree Classifications

Third – a student must achieve an aggregate mark of 40%
Lower Second – a student must achieve an aggregate mark of 50%
Upper Second – a student must achieve an aggregate mark of 60%
First - a student must achieve an aggregate mark of 70%
