

The Intangible Economy

<u>Jonathan Haskel</u>, Imperial College Business School, Imperial College, London

@haskelecon

RES/ONS/RSS meeting, "Challenges for Economic Statistics in the Digital Age", Wednesday 05 July 2017, 3:00pm - 6:00pm

Joint work with Carol Corrado (The Conference Board, New York), Cecilia Jona-Lasinio (Istat and LUISS Rome), Massimiliano Iommi (Istat and LUISS Rome)

Book project with Stian Westlake "<u>Capitalism without Capital</u>", November 2017. <u>Contents and first chapter</u>.

We need to understand economies

Which used to produce this...

...and now produce this.

What do companies look like?

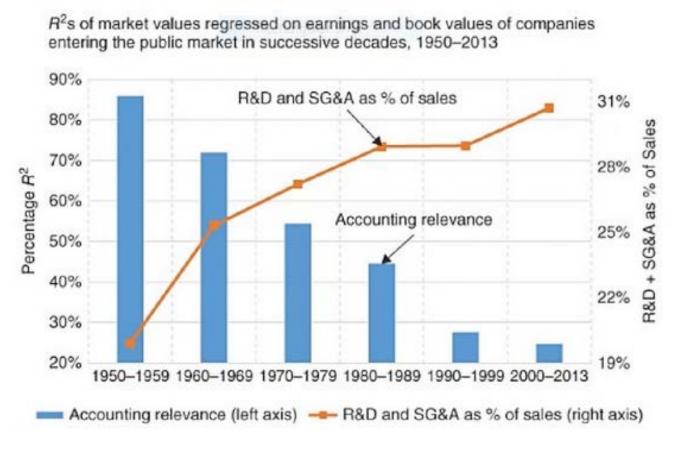

| | Sainsbury's | Microsoft |
|--------------------------------|-------------|-----------|
| Sales | 24bn | 85bn |
| Assets: Property, equipment | | |

What do companies look like?

| | Sainsbury's | Microsoft |
|--------------------------------|-------------|-----------|
| Sales | 24bn | 85bn |
| Assets: Property, equipment | 10bn | 5bn |

Capitalism without Capital

Lev on declining informativeness of company accounts.

Investment in modern economies

| Tangible investment | Intangible investment | | |
|--|--|--|--|
| Buildings and structures | Computerised information | | |
| IT equipment (computer hardware, communications equipment) | Software | | |
| Non-computer machinery, equipment and weapons systems | Databases | | |
| Vehicles | Innovative property | | |
| | R&D and mineral exploration | | |
| | Creating entertainment, literary or artistic originals | | |
| | Design | | |
| | Economic competencies | | |
| | Training | | |
| | Market research and branding | | |
| | Business process re-engineering | | |

New investments mean...

New GDP

$$P^{Q}Q = P^{Y}Y + P^{N}N = P^{C}C + P^{I}I + P^{N}N$$

New sources-of-growth

$$d\ln Q = s_Q^L dlnL + s_Q^K dlnK + s_Q^R dlnR + dlnTFP$$

- This approach helps make sense of
 - Innovation as an investment and spillover, not all just a Solow-type spillover
 - The knowledge economy
 - The creative economy
 - Big data
 - Productivity, TFP and spillovers
- Statistical agencies are starting to collect these data, but only slowly

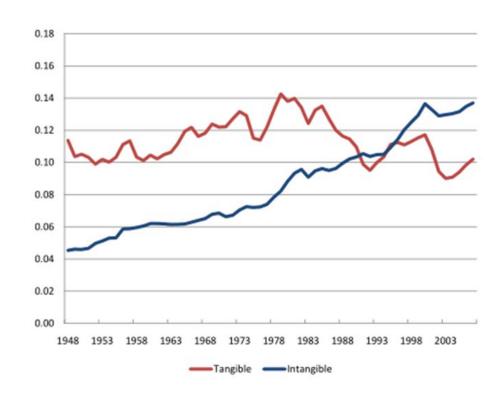

Data

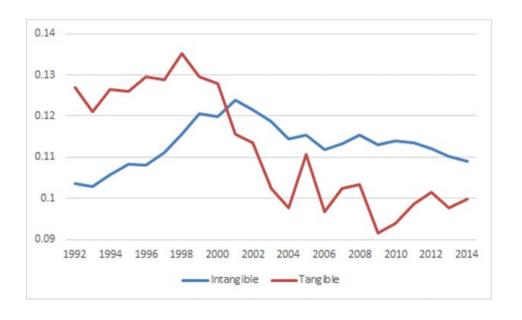

- Thanks to EU support, series of projects have built on EU-KLEMS
 - COINVEST
 - SPINTAN
 - EIB project
 - www.INTAN-invest.net (unfunded)
- Data set
 - Country-industry-institutional sector-year tangible/intangible investment
 - Years: 1995-2013
 - Industries: A to M, P,Q,R and S
 - Countries:
 - EU15xLU (Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Netherlands, Portugal, Spain, Sweden, UK
 - NMS: Czech Republic, Hungary, Slovakia and Slovenia
 - USA
- Productivity accounting for subset of countries (<u>www.Spintan.net</u>)
 - GDP/GVA by industry (new investment)
 - Capital prices (new capital assets)
 - TFP

So what's been happening to tangible and intangible investment? The long term...

Intangible and tangible investment over time, US

Intangible and tangible investment over time, UK

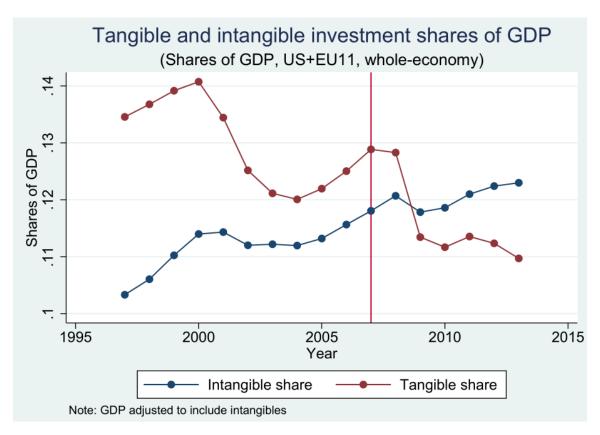

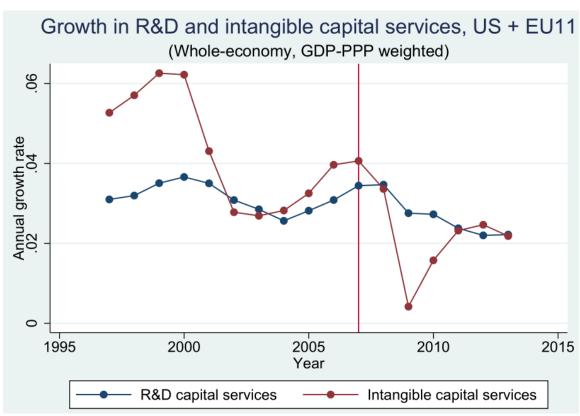

Source: Carol Corrado

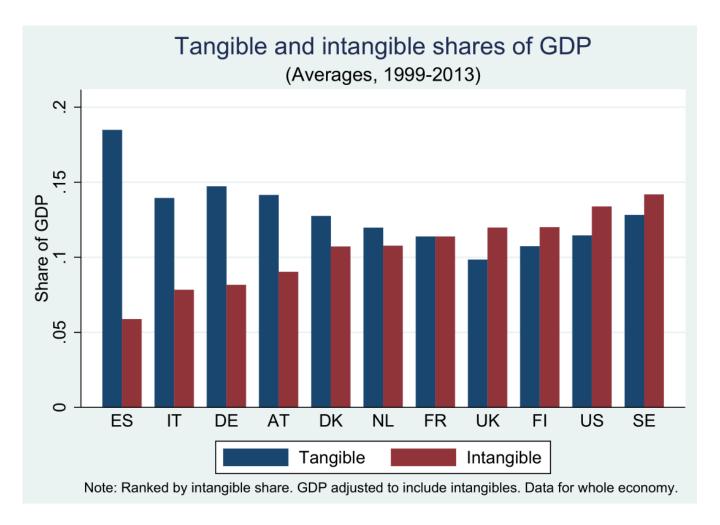

Source: Peter Goodridge

...shorter term: slowdown in capital services growth since 2008...

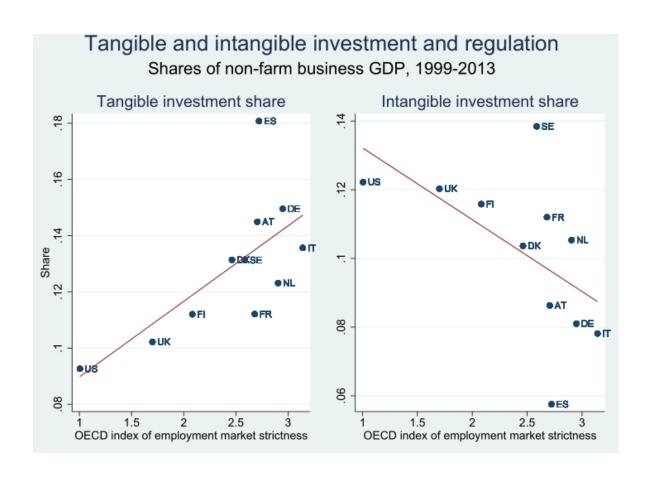

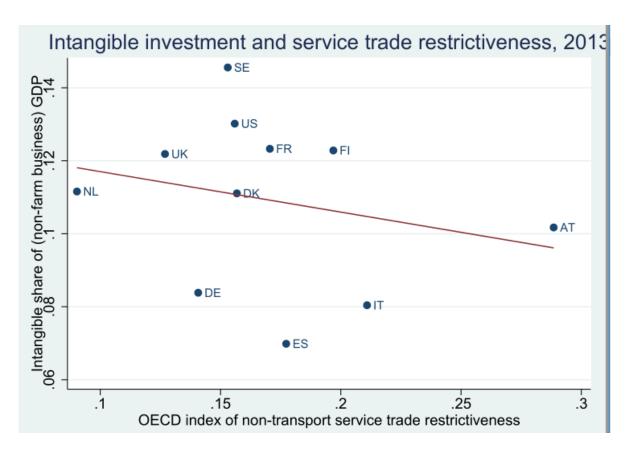

Variation over countries...

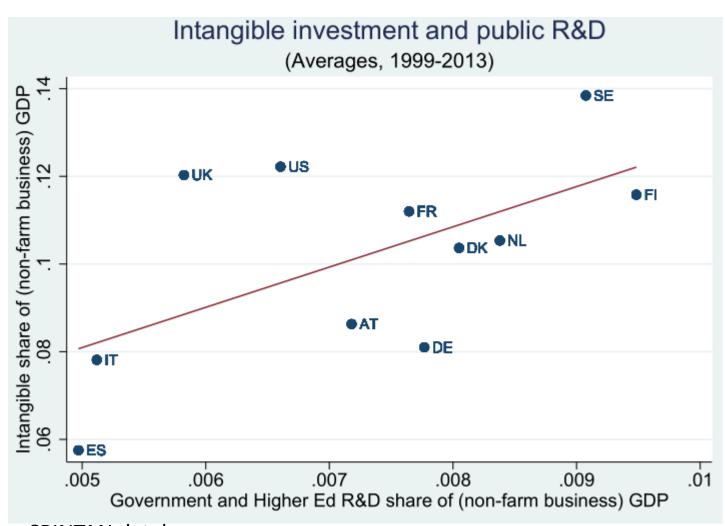

...correlated with policy-relevant variables...

...including public R&D

Properties of intangibles 1: Accounting conventions

- In company and national accounts, many are unmeasured
- Typical treatment in company accounts
 - If own-account, expensed, not capitalised
 - If bought-in, valued and depreciated
 - If company is sold "goodwill" is valued
 - (some software and R&D can be capitalised under restrictive circumstances e.g. late in development stage)
- Should national accounts stick to company accounts conventions?
 - Treatment asymmetric
 - Varies by industries (e.g. airport landing rights are allowed)
- Implications
 - It not counted at all, it looks like we have some fabulously profitable companies (in return on capital terms i.e. huge sales, no capital.

Properties of intangibles 2: economic properties

- Properties of intangibles- the four "S"s (<u>Haskel/Westlake</u>)
 - Sunk investment cannot be recovered
 - Scalable fixed investment e.g. in Uber software, can be scaled
 - Spillovers knowledge investment can be used by others
 - Synergies investment synergies with other intangible capital and human capital

• Implications:

- Sunk: financing difficulties
- Spillovers: demand for living in cities rises
- Scalable: intangible-intensive companies get relatively larger => frontier gap gets bigger
- Synergies: potentially large wage gains for intangible capital owners

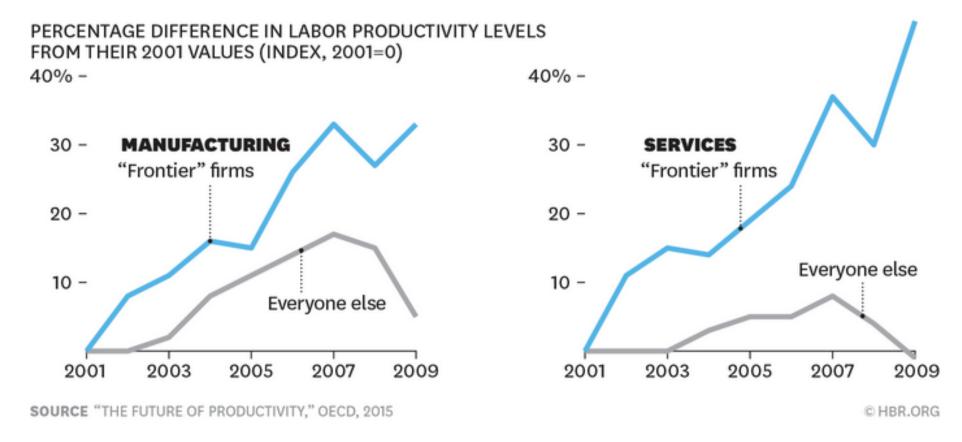

Example of implications of intangibles: scalable

- Are intangibles worsening the productivity gap between leading firms and laggards? (Haskel and Westlake)
- Tangible-intensive industries
 - constant returns,
 - successful companies expand, but are no more productive. Frontier gap stays the same
- Intangible-intensive industries, scalable,
 - Increasing returns
 - successful companies expand and get more productive. Frontier gap widens
- Test: Productivity gap widens (the most in intangible-intensive industries)

The widening productivity gap

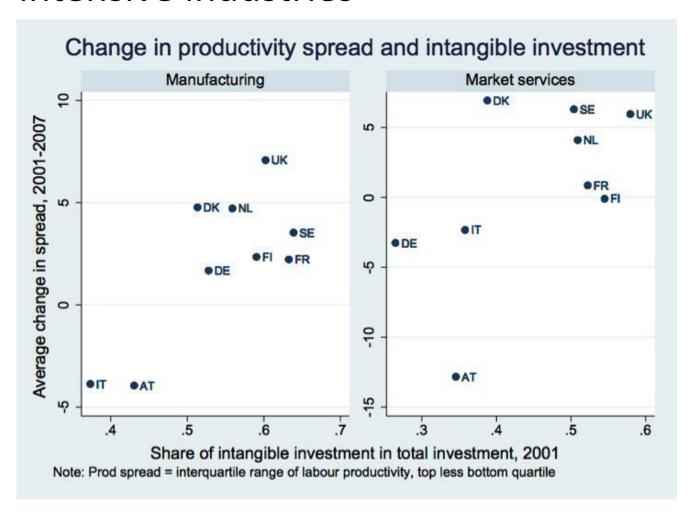

The Gap Between the Most Productive Firms and the Rest Is Growing

A look at labor productivity in manufacturing and services.

Source: Andrews, D. C. Criscuolo and P. Gal (2015),

The productivity spread has risen the most in intangibleintensive industries

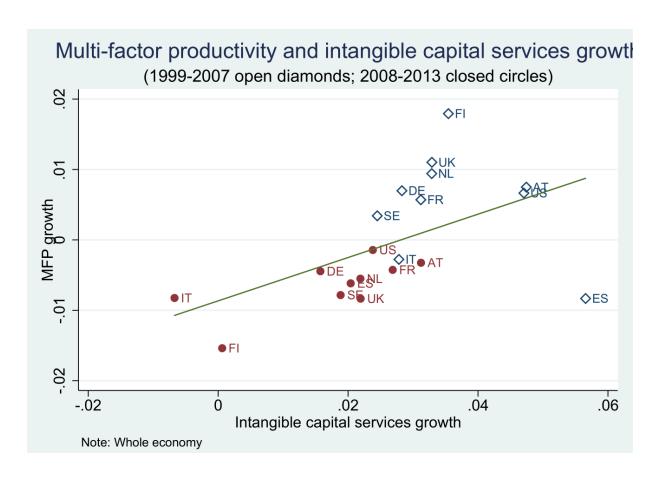

And if these firms pay higher wages to all workers, wage inequality rises too.

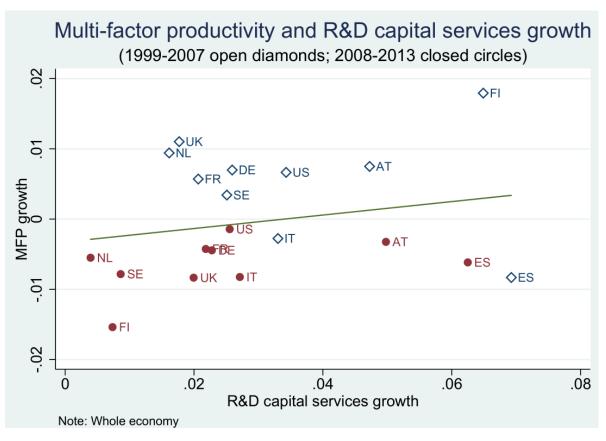

Source: <u>Haskel and Westlake</u>, 2016, using data from SPINTAN and Distributed Microdata project

Example of implications of intangibles: spillovers

- Tangible assets: unlikely to be spillovers
- Intangible assets:
 - If there are spillovers,
 - fall in intangible capital building => fall in TFP growth

Spillovers?

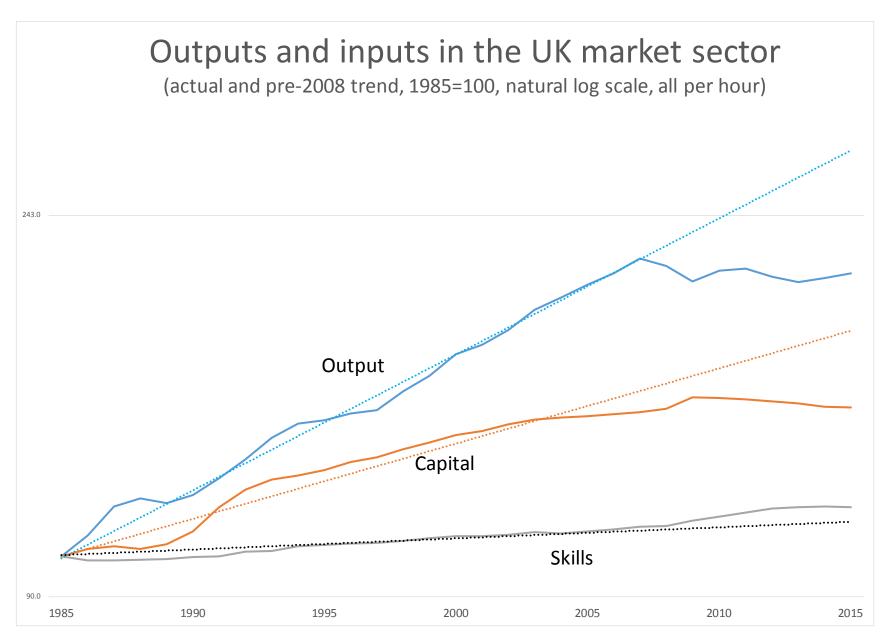

Summary

- Investment is becoming more intangible
- That's not well measured
- If you incorporate it: better understanding of
 - Innovation, creative economy, manufacturing v services, TFP etc.
- What do we find?
 - Big differences: between countries: Greece v Finland
 - Over time: intangible investment did not fall as fast over the recession, but is growing slower
 - Intangible investment correlated with policy instruments e.g. strictness of employment legislation
- So what?
 - Increasing productivity inequality in intangible-intensive sectors => productivity and wage inequality
 - Seems evidence of spillovers: more intangible capital growth, more TFP. So slowdown of intangible capital growth => TFP slowdown

Spares

The UK productivity puzzle

Accounting for the gap (in 2011)

| | | | | | % of gap |
|----|---|----------------|---------------|-------------|-----------|
| | | Before (00-07) | After (07-11) | Implied gap | explained |
| 1 | DlnV/H* | 2.54% | -0.47% | 12.6 | |
| | Components | | | | |
| 2 | Labour | 0.22% | 0.63% | -1.7 | |
| 3 | Capital | 1.13% | 0.99% | 0.6 | |
| 4 | TFP | 1.19% | -2.09% | 12.9 | 0% |
| 5 | Labour re-allocation | -0.26% | 0.23% | -1.9 | |
| | R&D | | | | |
| 6 | TFP: without R&D capitalised | 1.21% | -2.10% | 13.0 | -1% |
| | Capital: premature scrapping | | | | |
| 7 | TFP: raise dep rates by 1.25 after 2009 | 1.19% | -1.53% | 10.8 | 16% |
| 8 | TFP: raise dep rates by 1.5 after 2009 | 1.19% | -0.95% | 8.6 | 33% |
| | Structural | | | | |
| 9 | TFP without Ag/Min/Utils & Financial Services** | 1.11% | -1.05% | 8.7 | 33% |
| | Cyclical | | | | |
| 10 | Utilisation (Basu, Fernald, Kimball) | 1.28% | -1.50% | 11.0 | 14% |
| 11 | Utilisation (Buildings, this paper) | 1.24% | -2.00% | 12.8 | 1% |
